## 2. Methods

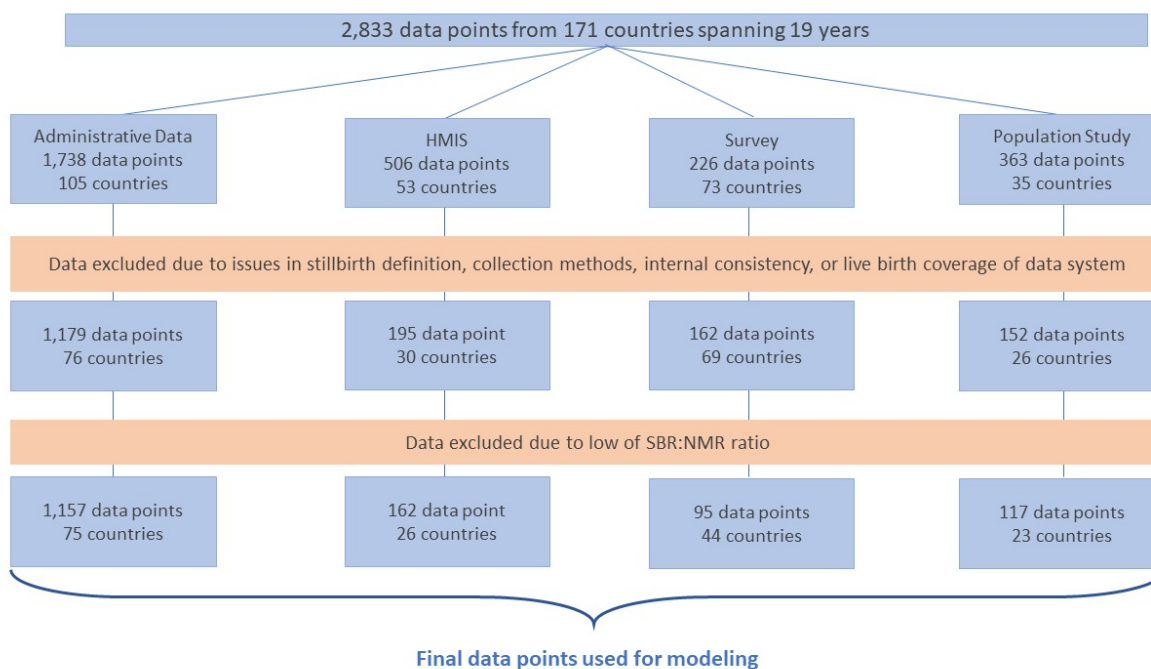

### 2.1. Overview

The UN IGME's approach to estimate stillbirth rates (SBR) includes the following steps:

1. Compile all available stillbirth data at a country level, derived from administrative sources, household surveys or population-based studies.
2. Evaluate data in accordance with the data quality criteria and produce adjustment or recalculation by applying standardized definitions.
3. Estimate global and country-specific trends of stillbirth rates using a smoothing time series model, supplemented with covariates associated with stillbirth rates. This process averages empirical data on stillbirths derived from the different sources for a given country. In the case of countries with sparse or no data, the identified covariates associated with stillbirth will inform the trend in stillbirth rate.

To increase the transparency of the estimation methodology and make stillbirth data available to users worldwide, UN IGME makes all data sources and stillbirth estimates available on its web portal at [www.childmortality.org](http://www.childmortality.org).

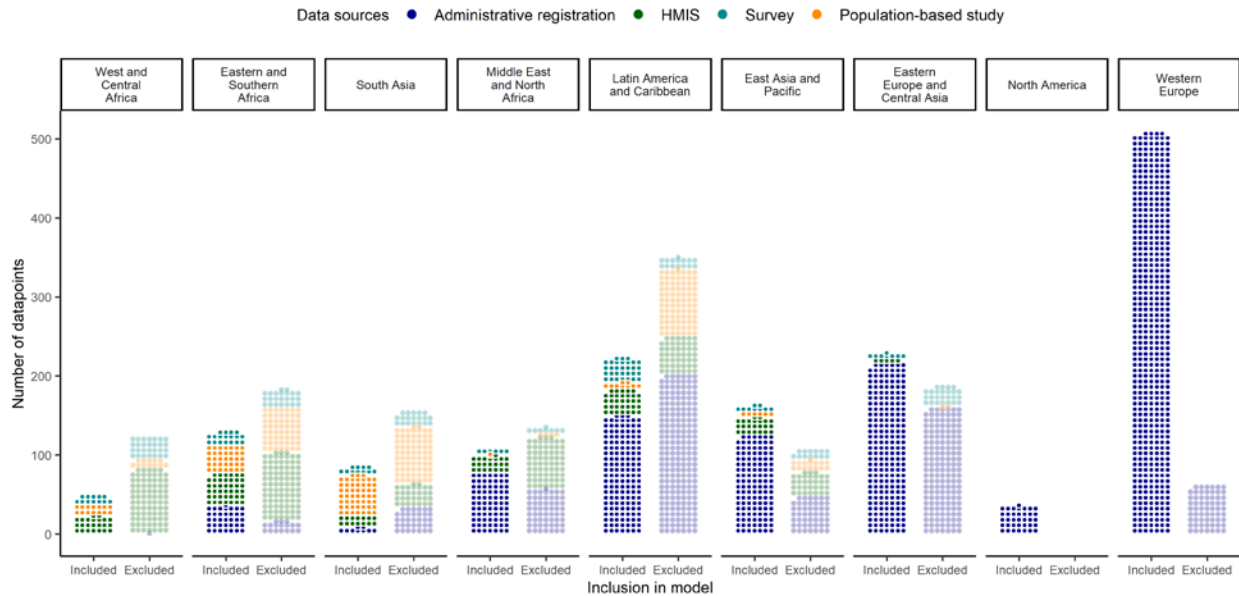

**Figure A1: Total stillbirth data and final data used in model by source type**

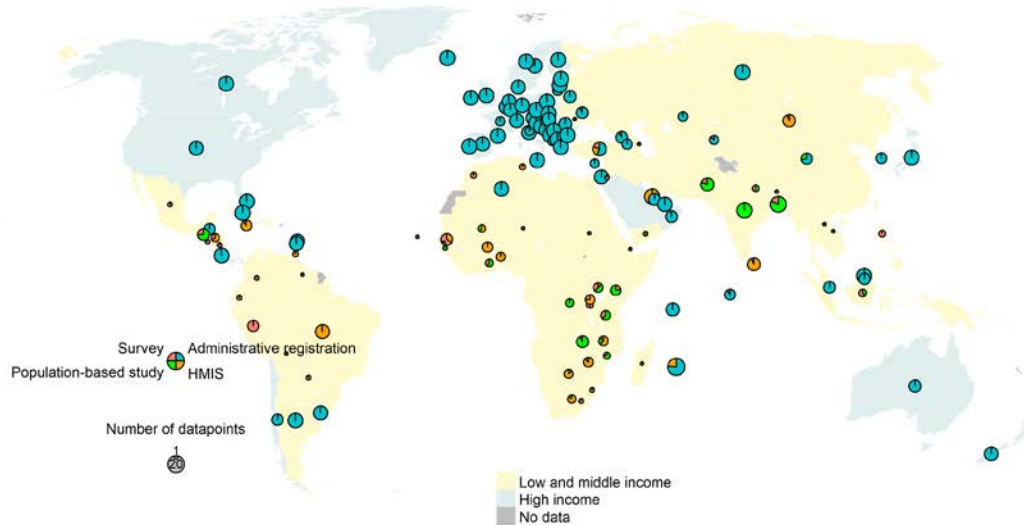

Estimates of stillbirth rates for a country are derived from various sources, such as administrative data (e.g. vital registration systems, birth or death registries, or health management information systems),

household surveys, or from population-based studies obtained from a review of academic literature. Additionally, data on factors associated with stillbirth rate are collected, to be used as covariates in the stillbirth estimation model. Table A5 lists the covariates used in the stillbirth estimation model and data sources.

**Figure A2: Data availability by source type and inclusion by region**

**Figure A3: Included data availability by source type and country**

**Note:** This map does not reflect a position by UN IGME agencies or those of the institutions to which the authors are affiliated on the legal status of any country or territory or the delimitation of any frontiers.

The majority of administrative data comes from registration systems and health data systems including health management information systems (HMIS). Often data from registration systems record stillbirths

and live births using detailed gestational age and/or birthweight. HMIS data are collected in health facilities and in many countries, the District Health Information System-2 (DHIS2) is the commonest HMIS data platform.<sup>1</sup> Few HMIS systems currently report detailed gestational age and/or birthweight data on stillbirths.

Information on stillbirths in household surveys -such as such as the United States Agency for International Development (USAID)-supported Demographic and Health Surveys, Reproductive Health Survey (RHS) and the UNICEF-supported Multiple Indicator Cluster Surveys- are usually collected in two different ways: with a full pregnancy history; or with a reproductive calendar.<sup>2</sup> In the pregnancy history (PH), women of reproductive age are asked about all pregnancies in their lifetime. For each pregnancy they are asked to provide information on the duration of the pregnancy, the outcome of the pregnancy (e.g., miscarriage, stillbirth or livebirth) and the date of birth or end of pregnancy. In some surveys with PH modules the women were only asked whether they had a stillbirth and the date of the stillbirth. In these cases, a seven-month duration of pregnancy was assumed. In some survey-specific cases, a stillbirth was defined by the questionnaire as a fetal death occurring at the fifth or sixth month or later. PH data allow the calculation of stillbirth rates for specific time periods in the past. PH data allow to calculate stillbirth rates for specific time periods. For PH data, the stillbirth estimates were calculated for 5-year calendar year periods instead of the 5-year periods (as measured by up to 4 years prior to survey administration) preceding the survey. We calculated stillbirth rates for 5 intervals (e.g. 25 years), before the survey date. The most recent 5-year calendar period was included in the estimation model.

In the reproductive calendar (RC), women are asked about the duration and month of pregnancy end for pregnancies that did not end in a live birth in the last 60 months. RCs are usually administered alongside a full birth history. In reproductive calendars the stillbirth rate is the number of pregnancies that are terminated in the seventh month or later of pregnancy divided by the number of pregnancies that reached at least the seventh month. The RC data allow the calculation of stillbirth rates for the 5-year period preceding the survey. However, stillbirth estimates from the RC were not included in the model if estimates from the PH in the same survey were available.

Population-based study data were sought for all countries without high coverage of routine administrative data. The literature review undertaken for the previous stillbirth estimates<sup>3</sup> was updated through to 29 January 2019. In addition, further reanalyzed population-based stillbirth data were obtained from a WHO data call to maternal-newborn health experts.

Data were excluded if: they lacked a clear source of definition or clear information on data collection systems; a high proportion of reported stillbirths had unknown gestational age or birthweight; data were internally inconsistent; or coverage of live births in administrative data systems was estimated below 80 per cent. Vital registration data with incomplete coverage of child deaths were also excluded. Consistency across data sources was further assessed by comparing stillbirth estimates to similar data sources within the same country and expected global and regional patterns in mortality.

As part of the assessment of data quality, the plausibility of the ratio of stillbirth rates (measured as per 28 weeks of gestation or more definition) to neonatal mortality rates was assessed, by comparing these ratios to the distribution of ratios obtained from high-quality LMIC study data. High-quality LMIC study data is defined as population-based prospectively collected data with recruitment prior to 28 weeks of gestation, and follow-up to at least 28 days of age of live births.

In assessing the SBR:NMR ratio in the input database, the NMR from the data source was used where available. Where data sources had missing NMR data, the estimated NMR by UN IGME was used. For observations from HMIS and population studies on stillbirths, the ratio of observed SBR to the UN IGME NMR was calculated and the same exclusion approach applied so that observations with extremely low SBR compared to national level NMR were excluded. In summary, the mean and variance of the setting-specific SBR:NMR ratios is estimated, assuming that each observed SBR:NMR ratio is the sum of a setting-specific SBR:NMR ratio and random stochastic error. If stillbirths were under-reported relative to neonatal deaths for a specific observation, its associated observed ratio of SBR to NMR would be lower than the true ratio. To quantify whether an observed ratio is 'extremely' low, the probability of observing a ratio that is smaller than the observed ratio was calculated (taking account of the uncertainty associated with the observed ratio) using the distribution of ratios obtained from the high-quality data. If this probability was less than 0.05, the observation was excluded from the database. This approach was applied to all observations in the database with 28 weeks of gestation or more definitions and adjusted 28-week definitions.

### 2.3 Assumptions for definitional adjustment of stillbirth data

Data limitations necessitated some assumptions regarding definitional adjustments. For survey data, a seven-month duration of pregnancy is assumed to be equal to a 28-weeks or more definition. Further, in LMICs it is assumed that the SBR observed using a stillbirth definition of a birthweight of 1,000 grams or more is equal to the SBR observed using the 28 weeks of gestation or more definition, and similarly that the SBR observed with a birthweight of 500 grams or more definition equals the SBR observed with a 22 week of gestational age or more definition.

### 2.4 Stillbirth estimation model

Estimation and projection of stillbirth rates is undertaken using a statistical model for all country-years. In the model, the SBR is estimated assuming that the

Observed  $\log(\text{SBR}) = \log(\text{true SBR}) + \text{bias} + \text{measurement error}$

where the true SBR in a country for years 2000 to 2020 = country-intercept + SBR predicted by covariates + country-specific temporal smoothing process. The bias refers to the definitional adjustment bias and source type bias. The measurement error refers to the stochastic sampling error, source type error, and additional error incurred from definitional adjustments. The model produces estimates of the SBR for years 2000 to 2020 with uncertainty.

Full details on the estimation model and statistical methods are described in Wang et al <sup>4</sup>.

### 2.5 Calculation of stillbirths

The number of stillbirths in each country is calculated using the following formula: Number of stillbirths = livebirths \* SBR / (1 - SBR). The annual estimate of the number of live births in each country from the World Population Prospects: the 2019 revision<sup>5</sup> are used along with the UN IGME SBR estimates to calculate the estimated numbers of stillbirths.

### 3. Regional classification

The Regional classifications refer to the UNICEF's regional classification. The regions of Western Europe and Eastern Europe and Central Asia are a sub-regions of Europe and Central Asia and Eastern and Southern Africa and Western and Central Africa are the sub-regions of Sub-Saharan Africa. For further details please refer to <http://data.unicef.org/regionalclassifications/>.

In addition, the World Bank Group income classification from the year 2020 was used. For further details please refer to <<https://datahelpdesk.worldbank.org/knowledgebase/articles/906519>> accessed August 3, 2020.

Western Europe	499	561
<b>Total</b>	<b>1,485</b>	<b>2,586</b>

Table A2: Data availability and inclusion by data source type

Source	Number of country-years available	Number included quality country-years
Administrative registration system	1,738	1,157
Health Management Information System (HMIS)	506	162
Household survey	226	95
Population based studies	363	117

Table A3: Definitional adjustment factors

Definition of stillbirths	LMIC	Bias on log-scale: $\log(\text{SBR}[\text{alternative}]) - \log(\text{SBR}[28])$	Standard deviation log-scale
22 or more weeks of gestation	Yes	0.2	0.1
22 weeks or more weeks of gestation	No	0.4	0.2
24 weeks or more weeks of gestation	No	0.2	0.2
Birth weight of 1000 grams or more	No	-0.1	0.1
Birth weight 500 grams or more	No	0.2	0.1

Table A4: Source type biases estimates and assumptions

Source	Bias log-scale, RR	Source type standard deviation	Assumption
Administrative registration systems	0	0.02	0 bias. Estimated standard deviation
Health Management Information System (HMIS)	0	0.05	0 bias. Estimated standard deviation
Population based studies	0	0.24	0 bias. Estimated standard deviation
Household survey	-0.2; 0.85	0.14	$N(0,25)T[,0]$ bias. Estimated standard deviation

Table A5: Covariates used in stillbirth estimation model and corresponding estimated coefficients

Covariate	Data Source	Estimate
GNI per capita based on purchasing power parity (PPP). PPP GNI is gross national income (GNI) converted to international dollars using purchasing power parity rates	World Bank: World Development Indicators database, World Bank	-0.116 (-0.19, -0.04)
Neonatal mortality rate: Probability of dying in the first 28 days of life, expressed per 1,000 live births	UN IGME: Modelled based on data from vital registration, household survey and population census	0.401 (0.32, 0.48)
Low birthweight: Percentage of live births that weighed less than 2,500 grams (less than 5.51 pounds)	UNICEF/WHO Low birthweight (LBW) estimates, 2019 Edition	0.097 (0.04, 0.15)
Antenatal care 4+ visits: Percentage of women (aged 15–49 years) attended at least four times during pregnancy by any provider	WHO/UNICEF: DHS, MICS and other national household surveys	-0.052 (-0.11, 0.01)
Mean years of schooling (female): Average number of years of education received by females aged 25 years and older, converted from educational attainment levels using official durations of each level	UNDP: Estimated by Barro and Lee (2016) using population census, MICS, DHS and other national surveys	-0.062 (-0.12, -0.01)
C-section rate: Percentage of deliveries by C-section	UNICEF: DHS, MICS, RHS and other national household surveys	-0.047 (-0.09, 0)

Note: Numbers in brackets are 95 per cent uncertainty intervals.

Table A6: Rates and number of stillbirths, by country or territory

Note: Numbers in brackets are 90 per cent uncertainty intervals.

Country/territory	Stillbirth rate (stillbirths per 1,000 total births)			Number of stillbirths

Table A7: Share of stillbirths, percentage decrease, annual rate of change in stillbirth rate, neonatal mortality rate and mortality rate among children aged 1–59 months, and ratio of stillbirth to neonatal mortality rate, by country or territory

Note: Numbers in brackets are 90 per cent uncertainty intervals.

Significant percentage decrease based on the lower bound of the 90 per cent uncertainty intervals: \*\*\*>=50%, \*\*>=25%<50%, \*>=10%<25%, >=0%<10%, †No significant decrease

Country/territory	Share of total stillbirths worldwide, 2019	Percentage decrease 2000 to 2019			Annual rate of reduction 2000 to 2019			Ratio of stillbirth rate to neonatal mortality rate, 2019
		stillbirth rate	neonatal mortality rate	mortality rate among children aged 1–59 months	stillbirth rate	neonatal mortality rate	mortality rate among children aged 1–59 months

Table A8: Series in SBR database by country or territory

Note: The series name refers to a specific data collection source and estimation method. There are several sources including vital registration data (including sample vital registration data) and sample surveys – where: vital registration series are based on birth and death registration data and survey series are based on data births and stillbirths from pregnancy histories or reproductive calendars.

Country or territory	Data series	Inclusion
Afghanistan	Health Survey 2018	0
