

Supplementary Information

RCA2 – An improved framework for reference component analysis of scRNA-seq data.

1 Reference panels

1.1 Included reference panels

In RCA2, we provide the following panels:

- a) Global panel from the original RCA (Li et al., 2017) containing both primary cell types and tissues.
- b) 15 hematopoietic cell types obtained from FACS sorted PBMCs (Novershtern et al., 2011): *Naive B-Cells, Mature B-Cells, Plasmacytoid Dendritic Cell, Myeloid Dendritic Cell, Hematopoietic stem cell, Megakaryocyte, Monocyte, Non-classical Monocyte, Mature NK cell_CD56+ CD16+ CD3, Naive CD8+ T-cell, CD8+ Effector Memory, CD8+ Central Memory, Naive CD4+ T-cell, CD4+ Effector Memory, CD4+ Central Memory*
- c) NovershternTCellPanel: Selection of six T cell sub-types from Novershtern et al. (Cell, 2011).
- d) 28 immune cell types obtained from blood samples (Monaco et al. 2019) : *Basophils, B-Ex, B-naive, B-NSM, B-SM, CD4 naive, CD8 CM, CD8 EM, CD8 naive, CD8 TE, C-mono, I-mono, MAIT, mDC, NC-mono, Neutrophils, NK, pDC, Plasma blasts, Progenitor, TFH, Th1, Th17, Th1/Th17, Th2, TReg, VD2negative, VD2positive.*
- e) MonacoBCellPanel: Selection of six five B cell sub-types from Monaco G., et al. (Cell reports, 2019).
- f) MonacoMonoPanel: Selection of five Monocyte sub-types from Monaco G., et al. (Cell reports, 2019).
- g) MonacoTCellPanel: Selection of 15 T cell sub-types from Monaco, G., et al. (Cell reports, 2019).
- h) Mus Musculus brain panel containing 7 cell types (Zhang et al. 2016): *Astrocytes, Neurons, Microglia, Endothelial Cells, Newly-formed Oligodendrocytes, Myelinating Oligodendrocytes, Oligodendrocyte Precursor Cells.*
- i) ENCODE homo sapiens panel containing 97 cell types generated using RCA2 build panel function: *Skin Fibroblast, Endodermal Cell, Neural Cell, T-Cell, Mesendoderm, Neural Stem Progenitor Cell, Endothelial Cell Of Umbilical Vein, Fibroblast Of Skin Of Abdomen, CD4-Positive, Alpha-Beta T Cell, Purkinje Cell, Fibroblast Of Breast, Smooth Muscle Cell, Trophoblast Cell, Common Myeloid Progenitor, CD34-Positive, Mesenchymal Cell, CD8-Positive, Alpha-Beta T Cell, Foreskin Keratinocyte, Mammary Stem Cell, Fibroblast Of Lung, Foreskin Fibroblast, Neurosphere, Myoepithelial Cell Of Mammary Gland, Skeletal Muscle Myoblast, Luminal Epithelial Cell Of Mammary Gland, Mesodermal Cell, Keratinocyte, B Cell, CD14-Positive Monocyte, Peripheral Blood Mononuclear Cell, Ectodermal Cell, Foreskin Melanocyte, Hepatocyte, Cardiac Muscle Cell, Bipolar Neuron, Natural Killer Cell, Astrocyte, Mammary Epithelial Cell, Aortic Smooth Muscle Cell, Epithelial Cell Of Umbilical Artery, Smooth Muscle Cell Of The Umbilical Artery, Tracheal Epithelial Cell, Nasal Cavity Respiratory Epithelium Epithelial Cell Of Viscerocranial Mucosa, Smooth Muscle Cell Of The Coronary Artery, Thoracic Aorta Endothelial Cell, Regular Cardiac Myocyte, Dermis Microvascular Lymphatic Vessel Endothelial*

Cell, Dermis Lymphatic Vessel Endothelial Cell, Bronchial Smooth Muscle Cell, Endothelial Cell Of Coronary Artery, Mesenchymal Stem Cell Of Whartons Jelly, Smooth Muscle Cell Of The Pulmonary Artery, Bronchus Fibroblast Of Lung, Endometrial Microvascular Endothelial Cells, Uterine Smooth Muscle Cell, Smooth Muscle Cell Of Trachea, Melanocyte Of Skin, Mammary Microvascular Endothelial Cell, Bronchial Epithelial Cell, Hematopoietic Multipotent Progenitor Cell, Bladder Microvascular Endothelial Cell, Fibroblast Of The Aortic Adventitia, Mononuclear Cell, Fibroblast Of Villous Mesenchyme, Placental Epithelial Cell, Osteoblast, Mesenchymal Stem Cell Of Adipose, Skeletal Muscle Satellite Cell, Cardiac Atrium Fibroblast, Epithelial Cell Of Alveolus Of Lung, Kidney Epithelial Cell, Vein Endothelial Cell, Renal Cortical Epithelial Cell, Myotube, Smooth Muscle Cell Of Bladder, Myometrial Cell, Neural Progenitor Cell, Pulmonary Artery Endothelial Cell, Hair Follicle Dermal Papilla Cell, Fibroblast Of Dermis, Lung Microvascular Endothelial Cell, Myocyte, Dermis Blood Vessel Endothelial Cell, Placental Pericyte, Articular Chondrocyte Of Knee Joint, Mesenchymal Stem Cell Of The Bone Marrow, Cardiac Ventricle Fibroblast, Airway Epithelial Cell, Epithelial Cell Of Proximal Tubule, Subcutaneous Preadipocyte, Pericardium Fibroblast, Mesangial Cell, Hair Follicular Keratinocyte, Glomerular Endothelial Cell.

- j) ENCODE Mus Musculus panel containing 15 cell types: *Erythroblast, Megakaryocyte, Erythroid Progenitor Cell, Megakaryocyte Progenitor Cell, Megakaryocyte-Erythroid Progenitor Cell, Granulocyte Monocyte Progenitor Cell, Hematopoietic Multipotent Progenitor Cell, Common Myeloid Progenitor, Monocyte, Neutrophil, Hematopoietic Stem Cell, Bone Marrow Macrophage, Embryonic Fibroblast, Myocyte, Leukemia Stem Cell.*
- k) A CITE-seq panel based on Seurat 4.0 containing 34 cell types: *CD14 Mono, CD4 TCM, CD8 Naïve, NK, CD8 TEM, CD16 Mono, B intermediate lambda, CD4 Naïve, CD4 CTL, B naive kappa, MAIT, gdT, CD8 TCM, dnT, B intermediate kappa, B memory kappa, pDC, B naive lambda, CD8 Proliferating, Treg Naïve, Plasma, CD4 TEM, Treg Memory, cDC2, NK Proliferating, ASDC, B memory lambda, HSPC, Platelet, CD4 Proliferating, Eryth, Plasmablast, cDC1, ILC.*

Panel (a) is identical to the panel from Li et al. (2017), used in the original RCA. Panels (b-h) have been generated in the same way as panels (a) (Li et al. (2017)). Panels (i-k) have been generated using the methodology described in the Section 6.

Panel (b) was created as follows: FACS sorted microarray of 38 immune cell types was obtained from the Gene Expression Omnibus (GEO) database; accession number: GSE24759. All progenitor cells as well as cells not assigned to a fully differentiated state were excluded as they did not exhibit a distinctive transcriptome. In addition, granulocytes (including neutrophils, basophils and eosinophils) as well as denucleated erythrocytes were excluded, resulting in 15 distinct immune cell types representing PBMCs populations. After quantile normalization and \log_{10} transformation of the data using the *preprocessCore* R package, two rounds of feature selection were performed. First, 2383 highly variable genes, were selected to generate the distance matrix and dendrogram plot of all cell types. Here, highly variable genes are defined as genes with an expression fold change relative to mean expression across all cell types being higher than 1.8. At this stage, replicates of cell types clustered far apart from the respective cell type clusters were labelled as outliers and consequently removed from the dataset. To further refine the feature genes, a pair-wise differential expression (DE) analysis between nodes in the dendrogram was performed using a two-sided *t-test*, considering a log fold change of 2 and a q-value cut-off of 0.05 as thresholds to determine de genes.

Taking the union of DE genes across all comparisons resulted in a combined set of 966 genes as final feature genes to compile a PBMC reference panel. Importantly, the majority of these genes (955 gene) have been already detected in the first round of feature selection testing for highly variable genes. This indicates that the feature refinement step led to removal of genes which are likely to be common across sub-populations of major cell types. Therefore, removing those improved our ability to detect sub-populations within major cell types.

1.2 Panel Selection

There are several ways how users can decide which reference panel to use. An obvious way is to choose the panel with most matched expected cell types. If expected cell type information is not available, we suggest to try either the Global, ENCODE, or CITE-seq panel.

In instances where the focus is on immune cells, we suggest to use the Noverstthern or the Monaco panel.

The ability to project cells against multiple reference panels at once helps to circumvent the “Panel Selection problem”, as it is an easy way to combine information from various panels in one reference space. For example, one can combine immune panels (e.g. CITE-seq, Noverstthern and Monaco) or for instance the more general Global and ENCODE Panels.

2 Supplementary Methods

2.1 Build Your Own Panel

First, it generates a pseudo bulk for replicates across cell types. Next, RCA2 calculates a PCA of a spearman correlation distance matrix of cell types and clusters the PCA representation of samples considering all PCs that explain at least 1% of the variance in the distance matrix. Based on a user-provided cut-height, similar cell types are identified and differentially expressed genes with a lenient log2 fold-change cut-off (default 2) are computed within the identified clusters using the default edgeR pipeline. This approach ensures that enough DE genes are computed for highly similar cell types without adding unnecessary amounts of noise to easily distinguishable cell types. Next, the default edgeR workflow is applied to call DE genes across all cell types using a more stringent log2 fold-change cut-off (default 6). The union of genes obtained from both steps is selected to be the feature set of the reference panel, which is constructed by selecting the rows corresponding to the features and by merging replicates.

2.2 Cell type annotation

From the projection matrix P , we identify, for each cell i , the cell type t associated to the highest score according to

$$t := \text{index}^{P_i}(\max(P_i)),$$

where index returns the column index corresponding to the cell type of the projection matrix P holding the highest correlation for cell i .

We compute two optional metrics that can be visualized in UMAP plots to estimate the confidence of cell type assignments.

Firstly, we assess the confidence of the annotation for each cell individually by computing a ratio-score r between $\max(P_i)$ and $\max_2(P_i)$ according to:

$$r=1-\text{abs}(\max(P_i)/\max_2(P_i)).$$

The value of r is close to 0 if the second highest score for cell i in P is similar to the highest score. If the value of r is smaller than a user-defined threshold, a cell will be labelled as *Unknown*. The ratio-score is visualized by adding transparency to the UMAP plots: The closer r is to 0 the more transparent a cell will be.

Secondly, we calculate a rank based score across all cells that are assigned to cell type t . Specifically, we compute for a cell i that has been assigned to cell type t , the relative rank of the cells score $P_{i,t}$ among all other cells labeled to be of cell identity t . The relative rank score is visualized by a color gradient.

2.3 GO and KEGG enrichment

By default, we consider cluster-specific background sets composed of genes expressed within each cluster. Alternatively, all genes expressed across all clusters or simply all genes available in the used annotation can be considered.

Several options are available to distinguish expressed from not expressed genes: a numeric threshold, the 1st quartile, the mean, the median or the 3rd quartile of the distribution of mean gene-expression values within one or across all clusters. For each tested cluster, RCA2 generates barplots, dotplots and GoPlots (if applicable).

2.4 Experimental details bone marrow data

Briefly, bone marrow aspirates were drawn from the posterior iliac crest of donors using standard operating procedures.

Mononuclear cells (MNCs) were isolated using density gradient separation using standard protocols.

Frozen BMMNCs were rapidly thawed at 370-degree C in RPM1 medium supplemented with 10% FBS and containing DNase1 (50,000 units) (catalog#260913, Calbiochem) to prevent cell clumping.

To isolate viable cells, BMMNCs were subjected to dead cell removal using a dead cell removal kit (catalog no. #130-090-101, Miltenyi biotec, Germany). Next, positive selection for CD34-positive cells was performed using the direct CD34 progenitor cell isolation kit (catalog no. #130-046-703, Miltenyi biotec, Germany).

The “flow-through” from the column was used as the CD34-negative fraction. Only samples with higher than 80-85 percent viability were used for downstream scRNA seq analysis.

Before loading the samples for scRNA sequencing into the Chromium system (10X Genomics), the single-cell suspension of CD34 positive and CD34 negative BMMNCs were re-counted and assayed for viability by trypan-blue exclusion principle based methodology. Cells were barcoded and UMI resolved single-cell sequencing libraries were generated using Chromium Single Cell 5' Reagent Kit (PN-1000006). We targeted 6,000 and 10,000 cells for CD34 positive and negative cell fractions, respectively.

We followed the instructions as listed in the manufacturer's product manual to generate an emulsion of cells entrapped along with barcoded beads.

The bead emulsion was transferred into a PCR strip and subjected to 13 cycles of cDNA synthesis. Subsequently, the synthesized cDNA was cleaned up with AMPure XP beads (A63881) and 25ng of cDNA were used for library preparation in compliance with manufacturer's instructions. Generated libraries were further cleaned up with AMPure XP beads and the final quantity and quality of libraries was assessed on Bioanalyzer using High Sensitivity DNA Kit (5067-4626, 5067-4627; Agilent).

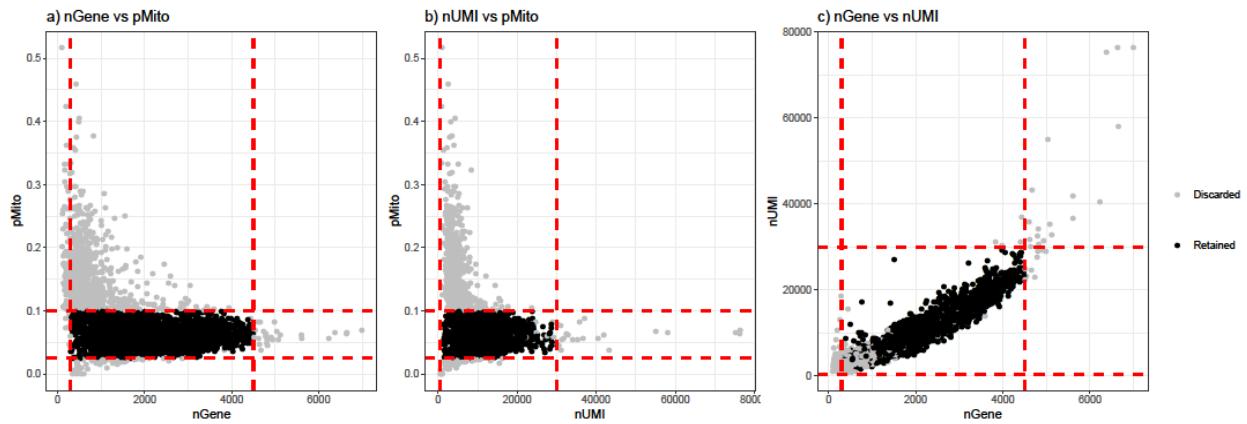

Each library was sequenced on one lane of a HiSeq4000, targeting 70,000-100,000 reads per cell.

2.5 Benchmarking of runtime and memory consumption

We benchmarked RCAv2 against RCAv1 with respect to the runtime of the projection and memory consumption using lovain graph based clustering. We obtained the original RCA implementation from <https://github.com/GIS-SP-Group/RCA>. The benchmarking is carried out on a large in-house single cell data set, which is downsampled to 1000, 2000, 5000, 10000, 20000, 50000, 100000 and 200000 cells, respectively. We use a notebook equipped with an Intel(R) Core(TM) i9-9980HK CPU @ 2.40GHz, 2400 Mhz, 8 Core(s), 16 Logical Processor(s) and 64GB memory for the benchmarking experiments.

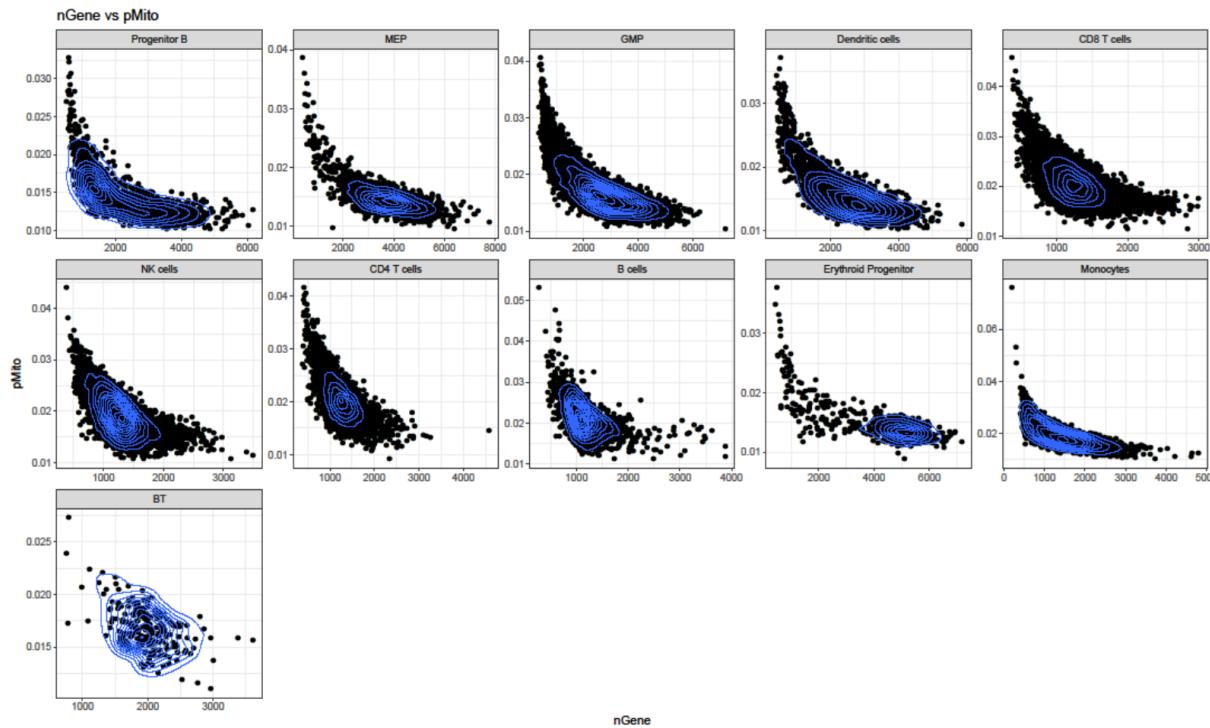

Upon downsampling we project the scRNA-seq data sets using the dataProject() function with default parameters. We use the system.time() function in R to measure the time used for computation and report the time from the *user* slot. Memory consumption of the dataSclust function is assessed with the profmem() function from the profmem library and the total sum of allocated bytes (excluding NAs) is reported. The same functions, system.time() and profmem(), are used to benchmark RCAv1, which was used using default parameters.

3. Supplementary Tables and Figures

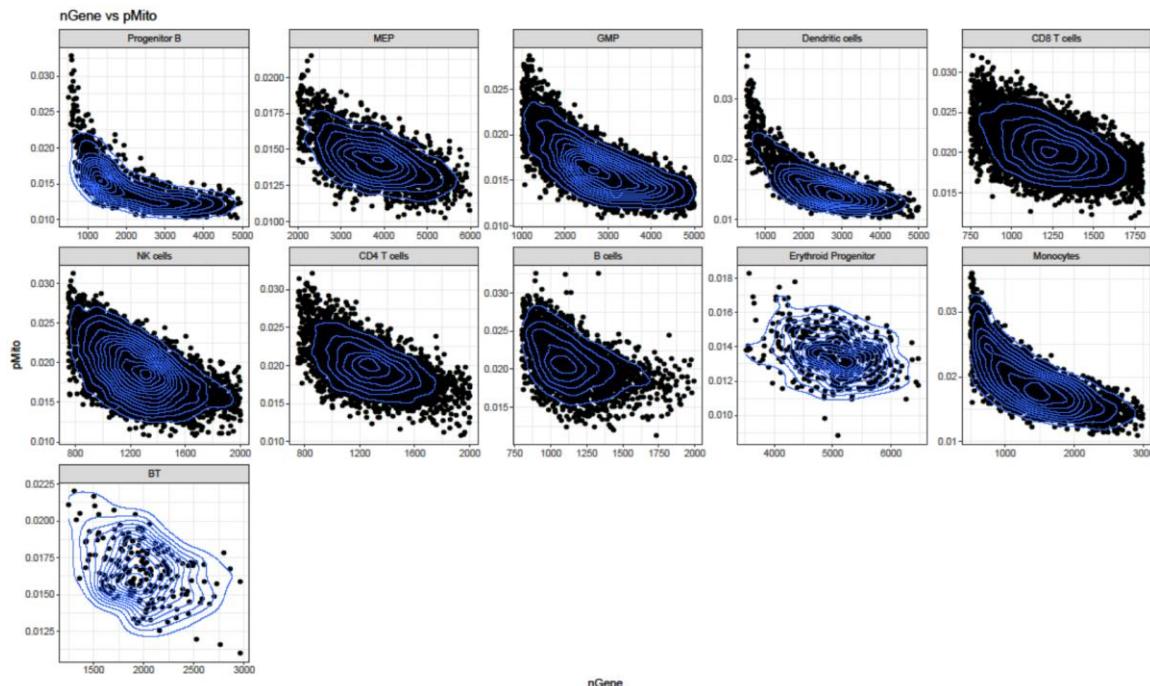

Supplementary Figure 1: Illustration of RCA2 quality control metrics and scatter-plots. As a quality metric, the number of detected genes (nGene), the mitochondrial rate (pMito) and the number of unique molecular identifiers (nUMI) are used. Red lines indicate user defined thresholds, cells colored black are retained and cells colored grey are discarded upon quality control.

Supplementary Figure 9: Illustration of the concept of batch effects. Consider three data, two sets representing T cells (red and blue) and one set representing B cells (orange). In a three dimensional space measuring transcriptomic similarity to T cells (x-axis), B cells (y-axis) and to a Batch variable (z-axis), we find the T cell clusters to be separated by the Batch affect, while in 2D space comprised of only T cell and B cell similarity, they would be very similar to each other and show high similarity to T cells but not to B cells. In contrast to that, the B cell cluster's position stays almost constant neglecting the Batch column, with a high similarity o B cells and a negative score with respect to T cells.
