

Circulating monocyte subsets 21 days post-immunization

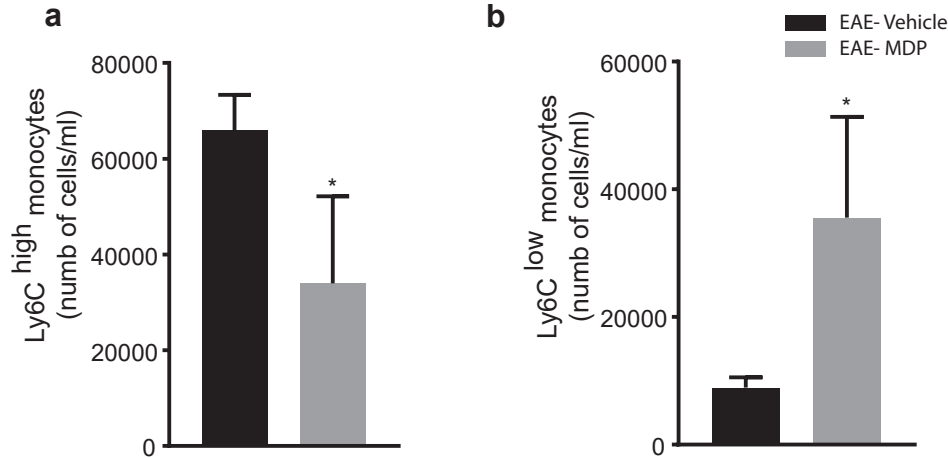

Fig.S3 Flow cytometry results of circulating monocyte subsets 21 days post-immunization.

(a) and (b) Absolute count of blood Ly6C^{hi} and Ly6C^{low} monocytes respectively following treatment with vehicle or MDP in EAE mice as measured by FACS post MDP injections (21 days post-immunization).

Data are expressed as the means \pm SEM; * $P < \text{or} = 0.04$ vs EAE-Vehicle.
