## STR Profiling Workflow

## Data Interpretation

Cell lines were authenticated using Short Tandem Repeat (STR) analysis as described in 2012 in ANSI Standard (ASN-0002) by the ATCC Standards Development Organization (SDO) and in Reid et al., Authentication of Human Cell Lines by STR DNA Profiling Analysis. Assay Guidance Manual [Internet], 2013 May 1 published by NCBI. The match criterion is based on an algorithm that compares the number of shared alleles between the reference and sample profile.

$$\% \text{ Match} = \frac{\text{Number of shared alleles}}{\text{Total number of alleles in the reference database profile}}$$

\* Homozygous alleles are counted as one allele

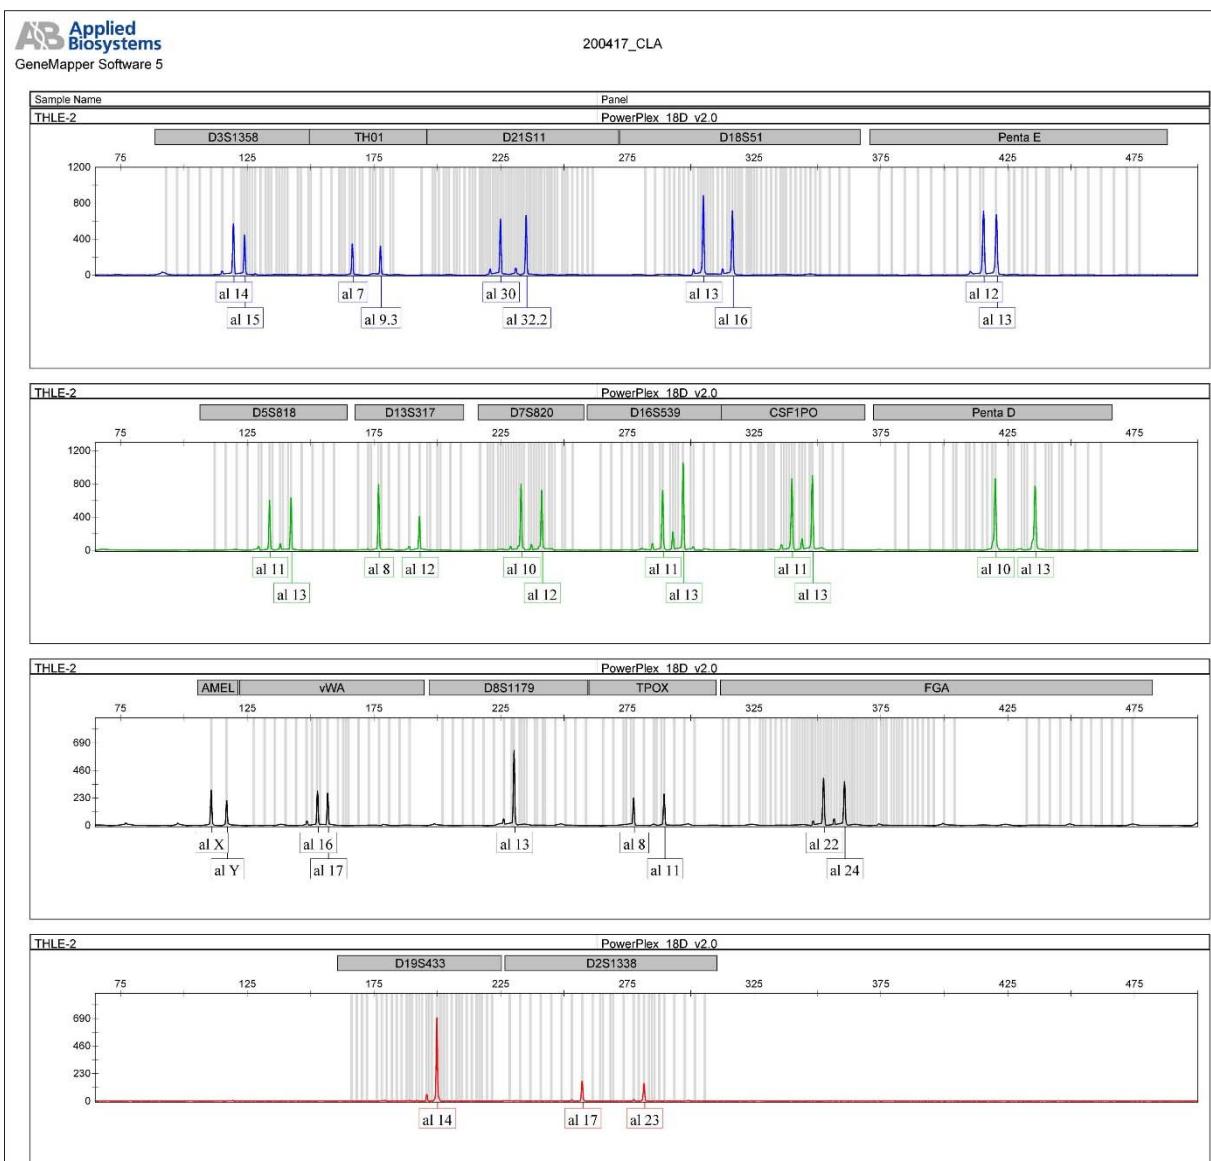

Lowest % Match	Result interpretation
≥ 80%	This result is consistent with the two samples being <b>related</b> (same donor)
56-79%	This result is <b>indeterminant</b> and may need further testing
≤ 55%	This result is consistent with the two samples being <b>unrelated</b> (different donors)

Sample No. 1
