Supplementary Methods 1 – The target trial	1
Figure S1 – Cumulative incidence curves.....	3
Table S1 – Definitions of variables used for the exposure, eligibility and adjustment.....	16
Table S2 – Definition of outcomes.....	23
Table S3 – Population characteristics of the eligible cohorts of vaccinated and infected individuals.	25
Table S4 – Outcome specific population tables for the vaccination exposure analyses	27
Table S5 – Outcome specific population tables for the SARS-CoV-2 exposure analyses	52
Table S6 – Risk ratios and risk differences (per 100,000 persons) of potential adverse outcomes for SARS-CoV-2 vaccination and SARS-CoV-2 Infection.....	77

Supplementary Methods 1 – The target trial

In the main text we simplified the specification of the interventions of the target trial as vaccination vs. no vaccination. A more precise specification of the interventions would be “vaccination and no exposure to SARS-CoV-2” vs. “no vaccination and no exposure to SARS-CoV-2”. That is, we sought to emulate a target trial in which individuals are assigned to either a vaccination or no vaccination, and in which all individuals in both arms are assigned to no coronavirus infection. This target trial is implicit in most observational studies of vaccine safety, which attempt to estimate the direct effects of vaccination that are not mediated through the vaccine’s preventive effect on infection.

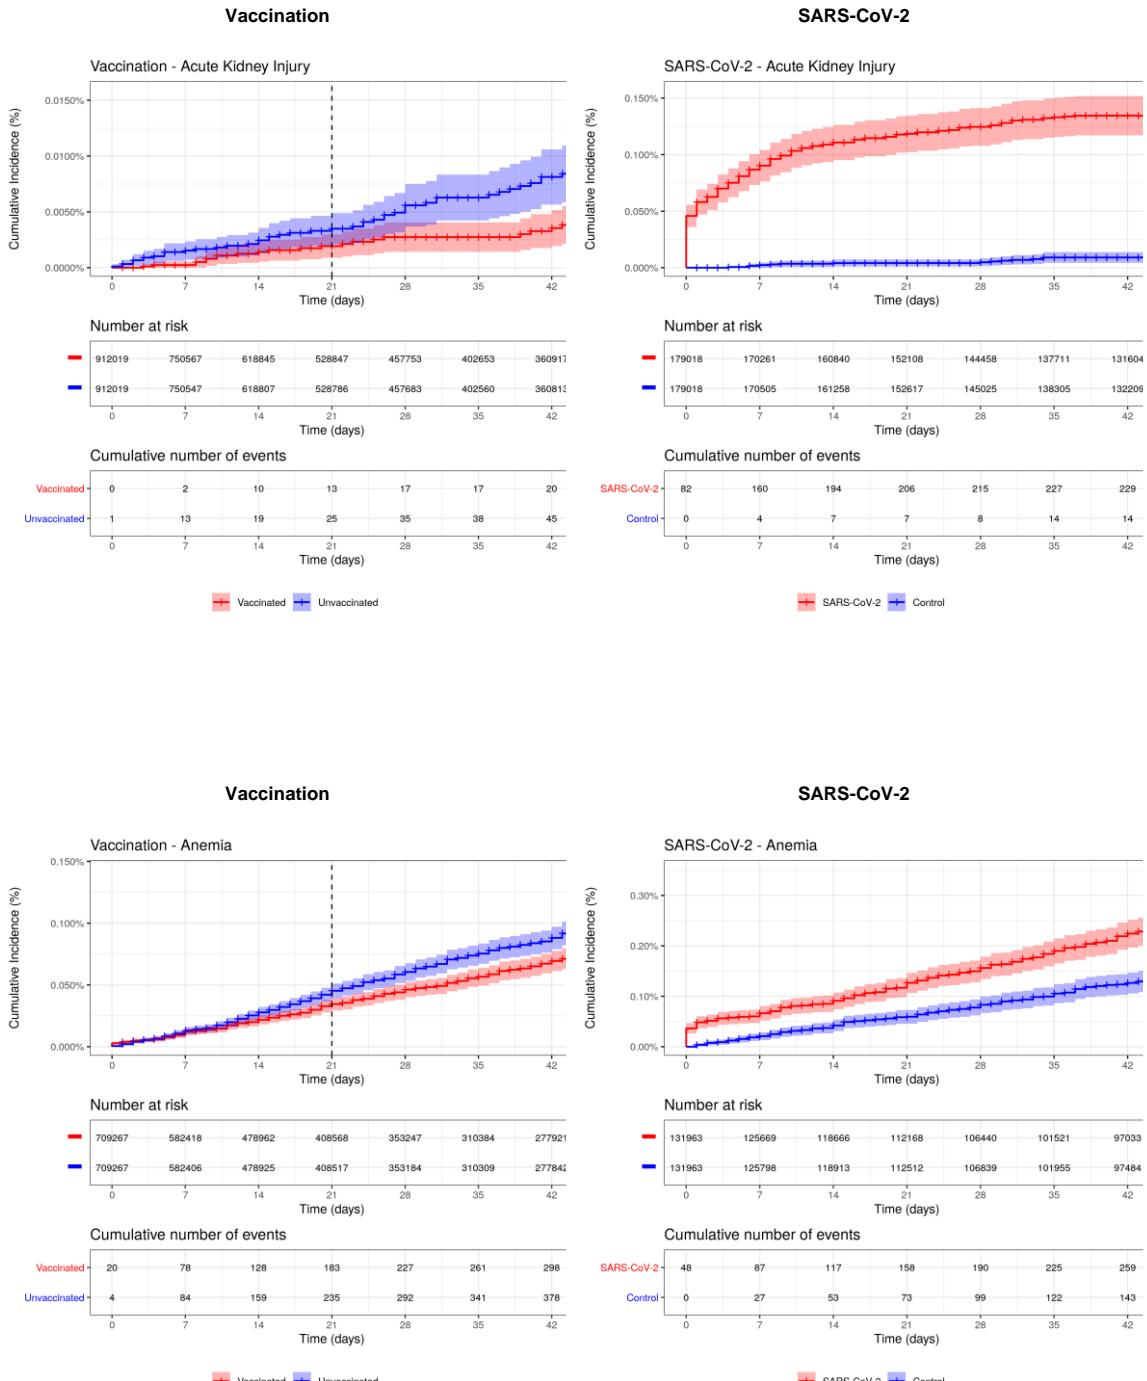

Otherwise, if the target trial allowed individuals to be exposed to SARS-CoV-2, we would likely observe that, for example, the vaccine protects against pneumonia because the vaccine protects against SARS-CoV-2 infection, which in turn causes pneumonia. If pneumonia was (theoretically) an adverse event of the vaccine, this effect could potentially be masked by the protective effect of the vaccine against the infection. In addition, if the target trial allowed individuals to be exposed to SARS-CoV-2, the incidence of the events mediated by SARS-CoV-2 infection would depend on the background rate of SARS-CoV-2 infection in the study population, which would make the effect estimates highly dependent on pandemic activity during the follow-up period.

To emulate a target trial in the absence of coronavirus infection, we censored individuals at the time of a documented SARS-CoV-2 infection diagnosis. Two potential issues arise from this approach: First, as mentioned in the manuscript text, some infections may not be documented, meaning that some of the effects observed may indeed be mediated through SARS-CoV-2 infection. Second, conditional on the matched covariates, uncensored individuals are assumed to have a risk similar to that

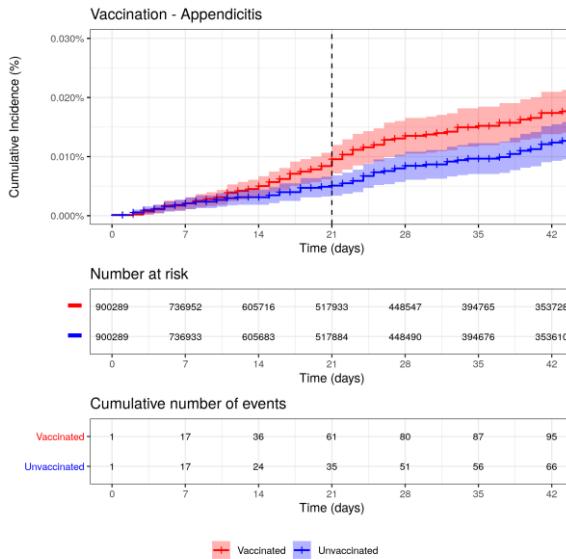

of the censored individuals had they not been infected, an assumption we have no reason to believe would be grossly violated in the present setting.

Figure S1 – Cumulative incidence curves

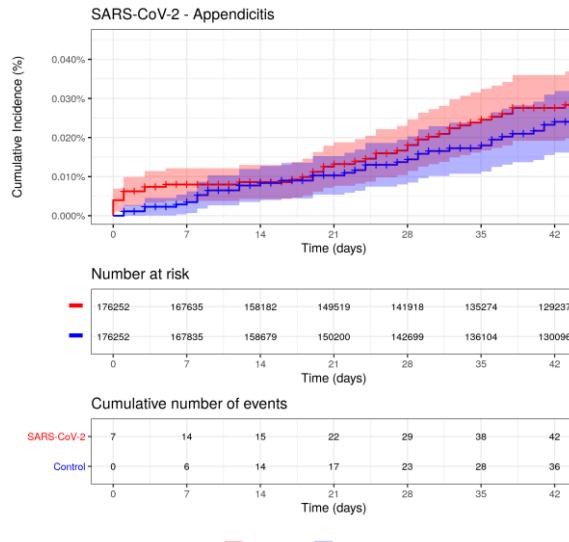

Cumulative incidence curves (one minus the Kaplan-Meier plot) for each of the two exposures for the different outcomes starting from the day of the first dose. Shaded areas are 95% confidence intervals. The tables below each curve show the number at risk at each time point and the cumulative number of events.

Table S1 – Definitions of variables used for the exposure, eligibility and adjustment

Names, potential values, definitions and time periods for all variables used in the study to define exposure, eligibility and perform adjustment. Variables were defined using internal CHS registries, ICD-9 codes, and ATC codes. PCR: Polymerase Chain Reaction; CHS: Clalit Health Services; ICD: International Classification of Disease; ATC: Anatomic therapeutic chemical; COPD: Chronic Obstructive Pulmonary Disease.

Variable	Values	Definitions¹	Timing²
Exposure			
SARS-CoV-2 Vaccination	0/1	Vaccination using the BNT162b2 mRNA Covid-19 Vaccine	The date of administration of the first dose.
Documented SARS-CoV-2 Infection	0/1	PCR-confirmed SARS-CoV-2 infection.	The date of specimen collection that was found to be positive in a PCR test.
Eligibility & Adjustment			
Age	Integer	Age in complete years	Current
Sex	Male/Female	As defined in CHS files	Current
Long-term care facility resident	0/1	Is patient a long-term care facility resident per CHS files	Current
Confined to Home	0/1	Is patient confined to his home per CHS files	Current
Health-care worker	0/1	Is patient a health-care worker per CHS files	Current
Continuous Membership in the Health Organization	0/1	Was patient a member of CHS for a full year before the index date	Last Year
Interaction with the Healthcare System	0/1	Has the patient had a community health encounter or hospitalization in the 7 days prior to the index date	Last 7 days
Place of Residence	List of places	Geo-statistical area in which the patient resides per CHS files	Current
Socioeconomic Status	0-6	Patient socioeconomic status, based on home address	Current
Population Sector	General Jewish /	As defined in CHS files	Current

	Arab / Ultraorthodox Jewish		
Pregnancy	0/1	As defined in CHS files	Current
Influenza vaccinations	0/1	Did patient receive an influenza vaccination in the last 5 years	Last 5 Years

Table S6 – Risk ratios and risk differences (per 100,000 persons) of potential adverse outcomes for SARS-CoV-2 vaccination and SARS-CoV-2 Infection

Estimates and 95% confidence intervals for the risk ratio and risk difference per 1,000 patients for different potential adverse outcomes following vaccination and SARS-CoV-2 Infection. Estimates were derived 42 days after exposure using the Kaplan-Meier estimator. Confidence intervals were estimated using the percentile bootstrap method with 500 repetitions. Estimates were only calculated for cells with more than 10 outcome events across both groups. RR: risk ratio; RD: risk difference; NA, not available.

Outcome	Vaccination					SARS-CoV-2				
	N	Events in Vaccinated Group	Events in Unvaccinated Group	Risk Ratio	Risk Difference (per 100,000)	N	Events in Infected Group	Events in Uninfected Group	Risk Ratio	Risk Difference (per 100,000)
Acute Kidney Injury	912,019	20	45	0.44 (0.23 to 0.73)	-4.58 (-7.83 to -1.75)	179,018	229	14	14.83 (9.24 to 28.75)	125.41 (106.97 to 142.57)
