Supplemental Figure 1. Representative SPR sensorgrams for the homodimer IIB-Fc:IIB-Fc and heterodimers IIB-Fc:ALK4-Fc, IIB-Fc:ALK7-Fc, and IIB-Fc:ALK3-Fc evaluated with individual SMAD2/3-pathway ligands (red) and SMAD1/5/8-pathway ligands (blue) to determine values for kinetic parameters shown in Table 1. Sensorgrams (black lines) are overlaid in most cases with fits to a 1:1 interaction model with mass transport limitations or in certain cases (identified in Table 1) with fits to a bivalent analyte model (red lines in all cases). The range of ligand concentrations used for curve fitting are indicated for each construct-ligand combination in Supplemental Table 1. RU, resonance unit.

Supplemental Table 1. Ligand concentration ranges used for curve fitting for all combinations of ligands and constructs.

Ligand	Reference	Heterodimers				Homodimers

Units are expressed as nM.

Supplemental Figure 2. Activity of IIB-hFc:IIB-hFc (human Fc) and IIB-mFc:IIB-mFc (mouse Fc) homodimers in wild-type mice. Twelve-week-old wild-type C57BL/6 mice were injected s.c. with IIB-hFc:IIB-hFc ($n = 8$, 5 mg/kg), IIB-mFc:IIB-mFc ($n = 8$, 5 mg/kg), or vehicle control ($n = 6$, PBS) twice weekly for 8 weeks. **(A)** Percentage change in mouse total body weight from baseline to end of 8 weeks. **(B)** Weight of the gastrocnemius muscle isolated by dissection on study termination at the end of 8 weeks. Veh, vehicle; mg/kg, milligrams per kilogram; NS, not significant. ** $P < 0.01$, *** $P < 0.001$.

Supplemental Table 2. Supplemental statistics for Figure 4.

	Parameter	Vehicle	IIB-Fc: IIB-Fc: 10 mg/kg	IIB-Fc: ALK4-Fc 3 mg/kg	IIB-Fc: ALK4-Fc 10 mg/kg
	Number of animals	9	9	9	9
