

Figure S1. VEGF induced durable changes in expression of genes within the Wnt pathway. Triplicate dishes of HG HRECs that were treated for the indicated duration with 1 nM VEGF were harvested, RNA was extracted and subjected to qRT-PCR using primers specific for the indicated gene. Data are mean \pm SD, n=3. The level of expression in unstimulated cells (black bars) was set to 1.0. For VEGF-treated cells (red bars) the data are expressed as fold increase over unstimulated cells; * p<0.05. Similar results were observed in at least 3 independent experiments.
