Supplementary Figures

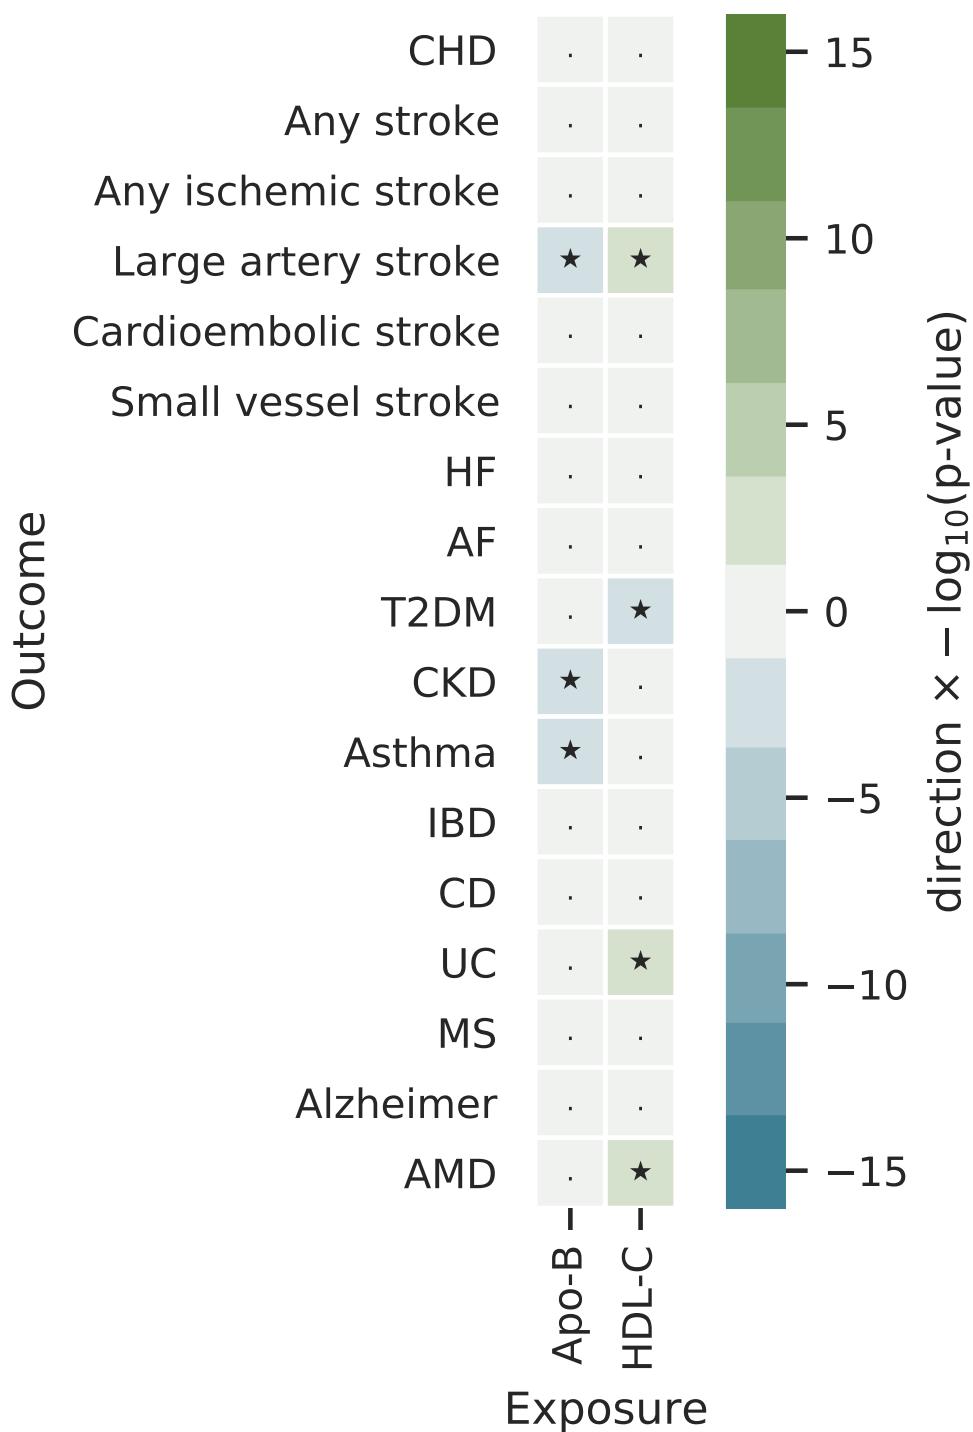

Supplementary Figure 1: Random effects meta-analyses of CETP inhibitors. The difference column presents a p-value for the difference in OR across the 4 compounds. Similarly; *** heterogeneity p-value < 0.001, ** 0.01 < p-value < 0.001, * 0.05 < p-value < 0.01, . p-value < 0.05. Abbreviations: LDL-C, low-density lipoprotein cholesterol; HDL-C, high-density lipoprotein cholesterol; TG, triglycerides; ApoB, apolipoprotein B; ApoA1, apolipoprotein A1; Lp[a], lipoprotein[a]; SBP, systolic blood pressure; DBP, diastolic blood pressure; ACM, all-cause mortality; CVD, any cardiovascular disease; FCVD, fatal-CVD; MI, any myocardial infarction; FMI, fatal-MI; ST, stroke; IST, ischemic ST; HST, hemorrhagic ST; HF, heart failure. The error bars represent 95% confidence intervals (95%CI), where the central dot depicts the odds ratio (LHS) or mean difference (RHS). The number of subjects and events are listed in table 3.

Supplementary Figure 2: Funnel plots assessing small sample treatment heterogeneity in cardiovascular (CVD) outcomes of CETP-inhibitors with more than one included trial (excluding the single study on Evacetrapib).

Supplementary Figure 3: Drug target MR effects of CETP and PCSK9 clinically relevant outcomes proxied by the genetic effects on LDL-C (for CETP and PCSK9), HDL-C and TG (for CETP). Results are coded in the canonical, treatment direction (HDL-C increase, LDL-C and TG decrease). The error bars represent 95% confidence intervals (95%CI), where the central dot depicts the odds ratio. The number of events and total samples are depicted in the figure as "Events/Total".

Supplementary Figure 4: Multivariable drug target MR assessing the potential Apo-B and HDL-C mediation pathway of the CETP effects on clinical outcomes. Colours indicate effect direction multiplied by $-\log_{10} p\text{-value}$, which was truncated at ± 16 . Results are coded in the canonical, treatment direction (HDL-C increase, Apo-B decrease). Stars indicate $p\text{-value} < 0.05$.

Supplementary Tables

Supplementary Table 1: CETP compounds evaluated in clinical trials

Compound	Maximum clinical de- velopment phase	Continued develop- ment
Anacetrapib	3	Terminated
ATH03	1	Terminated
Dalcetrapib	3	Ongoing
DRL-17822	2	Terminated
Evacetrapib	3	Terminated
JTT-302	2	Terminated
K-312	1	Terminated
Obicetrapib	2	Ongoing
Rocacetrapib	2	Terminated
Toracetrapib	3	Terminated

Supplementary Table 2: CETP inhibitor trials

Trial	Pubmed ID	Participants	CETP compound	Comparison	Background therapy	CETP dose (mg)	Median follow-up (days)	No. of subject in the intervention group	No. of subject in the comparator group
ARAI	27131642	FH patients	Anacetrapib	Placebo	Any Kind Of Statin + Potential Other Lipid Lowering Therapies	100	168	34	34
REVEAL	28847206	Patients with atherosclerotic vascular disease	Anacetrapib	Placebo	Atorvastatin	100	1497	15225	15224
REALIZE	25743173	FH patients	Anacetrapib	Placebo	Any Kind Of Statin Or Ezetimibe	100	448	204	102
DEFINE	21082868	Patients with coronary heart disease or at high risk for coronary heart disease	Anacetrapib	Placebo	Any Kind Of Statin Or Ezetimibe	100	532	811	812
TERAMOTO	28478132	High risk dyslipidemia patients	Anacetrapib	Placebo	Any Kind Of Statin + Potential Other Lipid Lowering Therapies	100	364	204	103
BALLENTYNE	28624096	Hypercholesterolemia subjects, not meeting treatment goals.	Anacetrapib	Placebo	Any Kind Of Statin + Potential Other Lipid Lowering Therapies	100	252	290	293
DAL-PLAQUE	21908036	Subjects with a history of CHD or a high risk of CHD	Dalcetrapib	Placebo	Any Kind Of Statin + Potential Other Lipid Lowering Therapies	600	168	64	66
STEIN	20097702	Subjects with a history of CHD or a high risk of CHD	Dalcetrapib	Placebo	Atorvastatin	900	336	89	56
DAL-OUTCOMES	23126252	Patients with a recent acute coronary syndrome	Dalcetrapib	Placebo	Best Available Care	600	943	7938	7933
DAL-VESSEL	22345126	Patients with CHD or CHD risk equivalent and HDL-C below 50 mg/dL	Dalcetrapib	Placebo	Any Kind Of Statin Or Ezetimibe	600	252	238	238
RADIANCE 1	17387131	FH patients	Torcetrapib	No CETP-I	Atorvastatin	60	730	450	454
RADIANCE 2	17630038	Subjects with mixed dyslipidaemia	Torcetrapib	No CETP-I	Atorvastatin	60	548	377	375
ILLUSTRATE	17387129	Patients with coronary disease	Torcetrapib	No CETP-I	Atorvastatin	60	730	591	597
ILLUMINATE	17984165	Patients with a history of cardiovascular diseases	Torcetrapib	No CETP-I	Atorvastatin	120	550	7533	7534
ACCELERATE	28514624	High risk patients with a history of ACS, PAD, or T2DM combined with coronary disease	Evacetrapib	Placebo	Any Kind Of Statin Or Other Lipid Lowering Therapies	130	791	6038	6054

Note:

FH, familial hypercholesterolaemia

Note:

NA's occurred due to a lack of coverage or, when all variants were removed due to a high risk of horizontal pleiotropy; Effects presented as mean difference (MD) and 95% confidence intervals (95%CI) per unit change in protein or lipid concentration coded in the canonical direction.

Supplementary Table 6: Drug target Mendelian randomization effects on clinical outcomes. CETP and PCSK9 effects were instrumented through genetic association with protein concentration or relevant lipid fractions

Note:

NA's occurred due to a lack of coverage, or when all variants were removed due to a high risk of horizontal pleiotropy; Effects presented as mean difference (OR) and 95% confidence intervals (95%CI) per unit change in protein or lipid concentration coded in the canonical direction.

Supplementary Table 7: Multivariable drug target Mendelian randomization. Assessing the potential lipid mediation of CETP or PCSK9 protein effects on clinical outcomes.

Supplementary note 2

CETP inhibitor dose-response and compound potency

In-silico IC₅₀ measurements, representing the dosage necessary for 50% inhibition, were extracted from ChEMBL (v25). The IC₅₀ measurement were relatively comparable between anacetrapib (7-60 nmol/L; n=5), evacetrapib (26-110 nmol/L; n=2) and torcetrapib (3-160 nmol/L; n=8). For dalcetrapib these measured were considerably higher: 4100-6000 nmol/L (N=2).

The four included CETP inhibitors all showed a dose response relation with high-density lipoprotein cholesterol (HDL-C). Evacetrapib had the strongest response, with HDL-C increasing between 54% and 129% (from baseline) at escalating doses of 30-500 mg per day[1]. Torcetrapib increased HDL-C by 16% to 91% (10-240 mg per day)[2], followed by anacetrapib: 9% to 48% (10-300 mg per day)[3]. At 4% to 34% for 300-900 mg per day[4], dalcetrapib, while still comparable to anacetrapib, showed the weakest dose response.

In general the difference in potency and dose-response were minimal between anacetrapib, evacetrapib, and torcetrapib, and were prescribed to a similar dosage in phase 3 RCT. The clear difference of dalcetrapib, which was considerably less potent, resulting in a marked increase in daily dosage, between 600 and 900 mg.

Supplementary Table 16: The preclinical drug potency (IC₅₀), drug response in phase 1 clinical studies and the final choice of drug dose in phase 3 RCT

Drug	Potency (IC ₅₀)		Phase 1		Phase 3
	Mean (nmol/L)	Range (nmol/L)	Dose (mg)	%Δ HDL-C (mg)	
Anacetrapib	36	17 to 60	10 to 300	9 to 48	100
Dalcetrapib	5050	4100 to 6000	300 to 900	4 to 34	600 to 900
Evacetrapib	68	26 to 110	30 to 500	54 to 129	130
Torcetrapib	52	3 to 160	10 to 240	16 to 91	60 to 120
