**Supplementary Figure 4 (related to Figure 2) Technical information and quality control of scRNA-seq library**

**(a)** Quality control for 10X Genomics data by genes (left panel), transcripts (middle panel) and ratio of mitochondria gene (right panel). The threshold for final analysis was set at gene number  $>1,000$  per cell and ratio of mitochondria gene  $<0.2$ . **(b)** Numbers, tissue and stage information of cells used in final analysis. **(c)** tSNE showing minimal batch effect among single cell libraries. **(d)** Violin plots of average UMI and gene numbers of scRNA-seq data. For box plot within each violin plot, center black lines indicate median values, boxes range from 25th to 75th percentiles, and whiskers correspond to  $1.5 \times \text{IQR}$ . **(e)** UMI (upper panel) and gene numbers (below panel) of identified cell clusters. For box plot within each violin plot, center black lines indicate median values, boxes range from 25th to 75th percentiles, and whiskers correspond to  $1.5 \times \text{IQR}$ .
