Supplementary Figure Legends

Figure S1. Human breast tumours are enriched in cell cycle regulators. High magnification of the STRING network reported in Figure 1A.

Figure S2. High expression levels of *BCL2*, *MCL-1*, alone or combined with *CDK1*, *CDK6*, and *WEE1*, correlate with lower survival rate of TNBC patients. Analysis of microarray data from 580 TNBC patients (GSE31519 Affymetrix Human Genome U133A Array). Kaplan-Meier curves report the probability of the overall survival of TNBC patients according to the expression levels of *BCL-2* (**A**) or *MCL-1* (**B**), alone or in combination with specific cell cycle regulators (*CDK1*, *CDK6*, or *WEE1*). In the combinations, the expression levels indicated correspond to those of the cell cycle regulators and either *BCL-2* (**A**) or *MCL-1* (**B**), respectively. The median of each gene expression levels was used as a threshold to segregate high versus low expressers. P values were computed using the Logrank (Mantel Cox) test.

Figure S3. MMTV-R26^{Met} TNBC cells are vulnerable to combined targeting of BCL-XL and CDK1/2/4.
(A) RNA-seq data from *MMTV-R26^{Met}* tumours (n = 4) versus control mammary gland tissues (n = 3). Enrichment pathway analysis, using WikiPathways 2015, ordered according to the combined score. The 10-top ranked enriched pathways are shown and highlight enrichment in cell cycle/DNA replication (red arrowhead) and DNA damage (green arrowhead) regulatory pathways. The cut-off applied to identify deregulated genes was P value < 0.05. **(B)** GSEA enrichment performed, using the WikiPathways database with the DNA damage response geneset, on *MMTV-R26^{Met}* tumours versus controls. The barcode plot indicates the position of a member of this geneset in the ranked list. Red and blue colours represent up- or downregulated genes in the *MMTV-R26^{Met}* tumours versus the controls, respectively. NES: normalized enrichment score; FDR: false discovery rate. **(C)** Cell viability outcomes of combined drug effects (see detailed matrix, Figure 3G) were used by the Compusyn software to simulate combination index (Y-axis) for each affected fraction (X-axis, from 0 to 1). Black dots correspond to tested concentrations. Based on the combination index scores, co-targeting of BCL-

XL (with A1155463) and CDK1/2/4 (with R547) resulted in synergistic interactions for MGT4, MGT9, and MGT11 cells. **(D)** Cell viability assay performed on the non-tumorigenic *MMTV-R26^{Met}* MGT2 cell line as well as on mitomycin C-treated mouse embryonic fibroblasts (MEFs). **(E)** Heatmap reporting expression or phosphorylation levels of proteins in the four tumorigenic *MMTV-R26^{Met}* cell lines as determined by RPPA. **(F)** Comparable protein levels of Cyclin B1, D1, and E1 in the four tumorigenic *MMTV-R26^{Met}* cell lines untreated or treated with the indicated drugs (based on the RPPA analysis; Table S9). **(G)** Representative graphs showing cell cycle analysis as measured by flow cytometry using PI and Ki67 staining of MGT11 cells untreated (no) or treated with the indicated drugs: A1155463 (A11, 1 μ M); R547 (3 μ M).

Figure S4. Dose-response curves of R547 + A1155463 or Adavosertib + A1155463 drug combinations.

The indicated cell lines were treated with varying concentrations of R547 and A1155463 (A11, 1 μ M) (green line) or with varying concentrations of Adavosertib (Adav) and A1155463 (1 μ M) (red line) for 48 h. The IC50 corresponding to each drug combination is indicated on the right.

Figure S5. Signalling perturbations in *MMTV-R26^{Met}* TNBC cell lines by blocking BCL-XL and CDK1/2/4.

MGT13 cells were untreated (-) or treated for 12 h with either A1155463 (A11: 1 μ M), R547 (3 μ M) or Adavosertib (Adav: 3 μ M), alone or in combination, then subjected to western blot analysis. Molecular weight markers (in kDa) are indicated on the right in all western blots. ACTIN and Ponceau (see also not edited gels) were used as loading controls.

Figure S6. Combined targeting of BCL-XL and CDK1/2/4 in *MMTV-R26^{Met}* MGT cells leads to downregulation of RTK and AKT signalling as well as of signals involved in cell cycle regulation and DNA damage/repair. High magnification of the STRING network reported in Figure 7B.

Figure S7. The A1155463 + R547 drug combination induces downregulation of both the endogenous MET and the MET transgene. Western blot analysis of endogenous mouse MET (mMET) and the MET

transgene (MET^{tg}) expression levels in the four $\text{MMTV-R26}^{\text{Met}}$ MGT tumorigenic cell lines (MGT4, MGT9, MGT11, MGT13) after a 12 h treatment with the indicated drugs.

Supplementary Table Legends

Table S1 - List of drugs used in this study.

Table S2 - List of antibodies used in this study.

Table S3 - Quantification of western blot analyses.

Table S4 - List of oligonucleotides (Figure 8I).

Table S5 - Enrichr analysis on breast cancer patients (GSE42568, GSE45827 and GSE54002) (Figure 1B).

Table S6 - Microarray analysis of GSE31519 (TNBC patients) (Figure 2A-C).

Table S7 - Enrichr analysis on $\text{MMTV-R26}^{\text{Met}}$ tumours (Figure 3B).

Table S8 - RNA-seq data on cell cycle regulators in $\text{MMTV-R26}^{\text{Met}}$ tumours versus controls (Figure 3C).

Table S9 - All deregulated signals in treated MGT cells.

Table S10 - Antibodies used for RPPA analysis of $\text{MMTV-R26}^{\text{Met}}$ treated cells.

Table S11 - Statistics of cell cycle distribution of MGT11 treated cells (Figure 5D).
