

Fig S1 UHPLC-QE-MS ion chromatograms of GC and PC tissue. Negative ion mode of GC tissue (a) and PC tissue (b), and positive ion mode of GC tissue (c) and PC tissue (d) of the same patient.

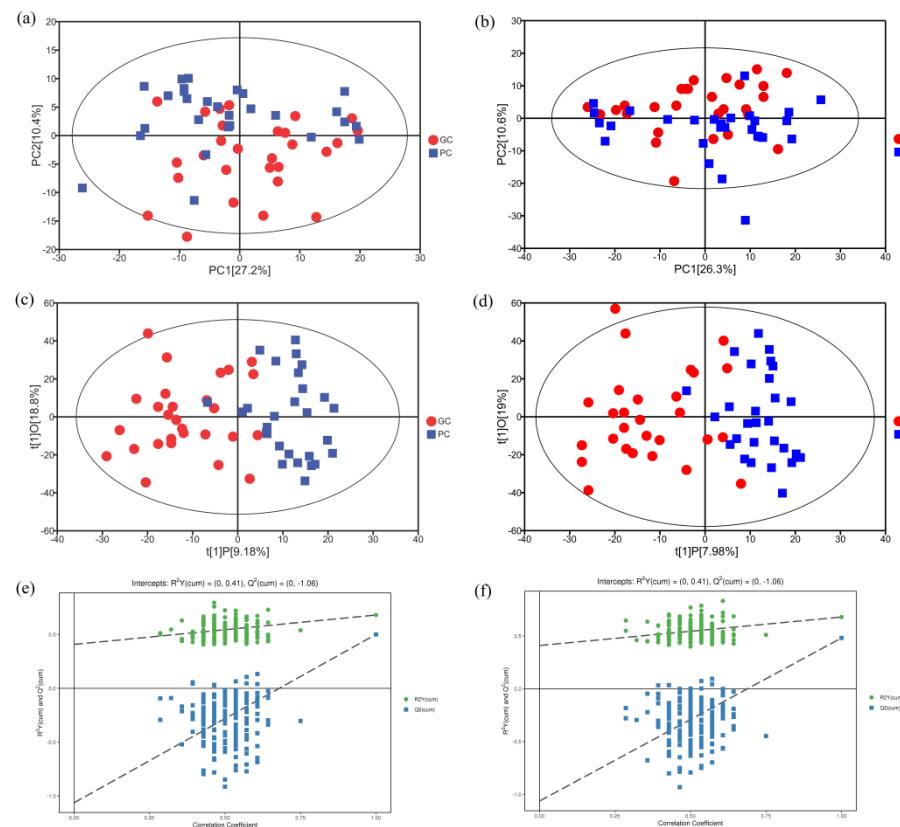

Fig S2 Identification of discriminating biomarkers by metabolome analysis. The PCA (a) and OPLS-DA (c) score plot and OPLS-DA (e) model are in negative ion mode. PCA (b) and OPLS-DA (d) score plot and OPLS-DA (f) model are in positive ion mode. The abscissa represents correlation between random group and original group, and ordinate represents scores of R^2Y and Q^2 . When permutation retention is 1, the values of Q^2 and R^2Y are close to 0.5 and 1 respectively, and Q^2 is with positive slope showing that models have good predictability and do not overfit.

Table S1 Details of 325 key metabolites identified by metabolomics

Ionization models	Metabolites	rt	m/z	Relative expression		VIP	P value	LogFC
