

Table S1. Upregulated coding Genes in YAP1 OFF D6 tumors compared to YAP1 ON. Upregulated genes in YAP1 OFF D6/ YAP1 ON tumor RNA-Seq include major urinary proteins (Mups), cytochrome p450 enzymes, and other metabolic liver enzymes. Coding genes with a p-value<0.05 shown.

	Fold Change	
Gene	FC (Mean(YAP1 OFF)+0.01) / (Mean(YAP1 ON)+0.01)	p-value

Extended Methods

Plasmid Vectors

Addgene Plasmids:

H430, pT2/C-Luc//PGK-SB13, Addgene # 20207 (1)

H65, pT3-N90-Beta Catenin, Addgene #31785 (2)

Donated Plasmids:

H73, pT3-TREt- YAP1^{S127A-} IRES-GFP was a gift from the Scott Lowe lab (3). H66, pT2-SB10 was a gift from the Hao Yin Lab.

Generated Plasmids

H550, pT2_TreT_YAP^{S127A}_IRES_GFP_PGK_mcherry

H549, pT2_TreT_YAP^{S127A}_IRES_GFP_PGK_FAH

H592, pT2_PGK_rtTA

H468, LentiV2_sg_YAP1

Lentiv2_sg_non-target

H550, H549 and H592 were generated using the New England Biolabs Gibson protocol and master mix kit per the manufacturer's instructions (Cat # E5510S). LentiCRISPR sgRNA cloning was performed according to Zhang Lab protocol as previously described (4).

Animal Studies Extended

Hydrodynamic Injection

All plasmids used for in vivo injection were purified using the Qiagen Maxi-Prep Endotoxin-free Kit (Qiagen, 12362) according to the manufacturer's instructions. 4-15 ug per plasmid per mouse were mixed together in 0.9% sterile saline at room temperature. Mice were weighed prior to injection and dosed with 10% body weight of the saline mixture. Plasmids were then delivered to mice by hydrodynamic tail vein injection. Specifically, within 5-7 seconds plasmids were continuously and smoothly injected (28). Mice were then warmed by heat lamp or heat pad for a minimum of 30 min to recover from injection shock.

TET-ON Studies

To establish doxycycline-inducible tumors, mice were treated with doxycycline chow (625 mg/kg) (TD.01306, Envigo) for up to 8 weeks following hydrodynamic injection. Doxycycline treated chow was refreshed weekly. Tumors were established in transgenic-rtTA (Tg-rtTA) mice and all downstream analyses were performed in Tg-rtTA mice unless otherwise noted in respective figure legends. The study endpoint for YAP1 ON tumor mice was 2+ signs of distress.

FAH Mouse Studies

Tumor was established in Fah^{-/-} mice as described above. Following tumor formation, doxycycline was withdrawn as previously described, and tumor regression monitored. During this time Fah^{-/-} mice were continuously treated with nitisone treated water NTBC (5 mg/ml) to prevent liver damage. Following tumor regression, NTBC was withdrawn and mouse weights monitored >2+ times weekly. Mice were continuously cycled onto NTBC following 10% body weight loss until weight restored. Once weight restored, NTBC was removed and mouse weights monitored.

Cell culture

293fs and HCT116 were gifts from Dr. Tyler Jacks. Cells were cultured in Dulbecco's Modification of Eagle's Medium (DMEM) (Corning 10-013CV), 10% serum (vol/vol) and 1% penicillin/streptomycin (vol/vol) under standard conditions, 37C in 5% CO₂ tissue culture incubator.

RNA Extraction, cDNA synthesis, Quantitative PCR

RNA was extracted from in vitro cell lines using the RNAeasy Qiagen RNA Isolation Kit (Catalog #74104) per the manufacturer's instructions. RNA was extracted from mouse liver tissue using TRIzol RNA Isolation Reagent (15596026) followed by a chloroform extraction. cDNA was synthesized using the High-Capacity cDNA Reverse Transcription Kit (4368814) and 1.5 ug RNA template. Quantitative PCR was performed using the SSoFast EvaGreen Supermix (1725200) and Real-Time PCR Detection System CFX96 by BioRad. Primers sequences are in **Supplementary Table 7**.

Histology and Immunohistochemistry

Mouse liver tissue was fixed with 4% formalin overnight and dehydrated in 70% ethanol. The UMassMed Morphology Core embedded tissues as 4μm paraffin sections and performed H&E staining. For immunohistochemistry staining, briefly tumor sections were deparaffinized with xylene, dehydrated with serial ethanol dilutions, and boiled for 9 minutes with 1 mM citrate buffer (pH6.0) for antigen retrieval. 3% hydrogen peroxide was used to inactivate endogenous peroxidase activities for 10 mins at room temperature. Samples with mouse primary antibodies were treated with M.O.M. Mouse on Mouse Blocking Reagent (Vector Labs, MKB-2213) per the manufacturer's instructions prior to blocking. Tissues were blocked with 5% normal horse serum from ImmPRESS™ HRP Anti-Rabbit IgG (Peroxidase) Polymer Detection Kit (Vector labs, MP-7401-50) for 1 hour at room temperature, incubated with primary antibody 4C overnight (**Supplemental Table 8**), secondary HRP antibody (Vector labs, MP-7401-50) incubation for 1 hour at room temperature, and diaminobenzidine (DAB) substrate/chromogen for development (Fisher Scientific, TA-125-QHDX). Slides were counterstained with hematoxylin, dehydrated in ethanol, xylene washed and sealed with a coverslip for long-term storage. H&E or IHC images were captured using a Leica DMi8 microscope. IHC slides were quantified by selection of four random fields per paraffin embedded section, and positive hepatocytes per 20X field counted.

Immunoblot

Whole cell extracts or mouse liver were lysed in RIPA buffer treated with 1:100 Halt phosphatase cocktail inhibitor (Thermo Fisher 78420) and 1:50 Roche Complete protease inhibitor (11836145001). Lysates were boiled for 5 minutes at 95C with Nupage 4X Sample buffer (Invitrogen NP0007). Protein concentration was measured using Pierce BCA Protein Assay Kit (Catalog #23225). Equal amounts of mouse liver protein were separated on a 4-12% Bis Tris gel and transferred to a nitrocellulose membrane and blocked with Odyssey Blocking buffer. Blots were probed with primary antibodies Gapdh 1:1000 (EMD MAB274), and GFP 1:2000 (CST 2956) overnight at 4C. Blots were then incubated with a fluorescent secondary antibody (LICOR) and imaged on the Odyssey Imaging Platform.

Immunofluorescence

Immunofluorescence was performed on paraffin embedded slides of mouse liver prepared by the UMassMed Morphology Core as described above. Briefly, slides were deparaffinized in xylene, dehydrated in serial ethanol dilutions, boiled for 9 minutes with 1 mM citrate buffer (pH6.0) for antigen retrieval, blocked for one hour at room temperature in Perkin Elmer PNB Buffer 0.5% weight/volume (Catalog #FP1012), and incubated with primary antibody O/N at 4C. Secondary antibody was diluted in PNB block and slides were incubated for one hour at room temperature and counterstained with DAPI (1 ug/ml) and mounted with Prolong Gold Antifade Mounting Media (Thermo Fisher, #P36934). Primary antibody used: MUP 1:200 Cedar Lane Labs, #GAM/MUP, Secondary AlexaFluor Goat 568, 1:200.

RNA Sequencing YAP1 ON, YAP1 OFF D6 Tumors

RNA-Sequencing Library Preparation and Analysis

RNA-Sequencing (RNA-seq) libraries for YAP1 ON and YAP1 OFF D6 were prepared as previously described (5, 6). RNA sequencing was performed in YAP1 ON and OFF tumors without luciferase (n=4 tumors). Library quantification was performed using the KAPA Library Quantification Kit. Libraries were sequenced using the Illumina NextSeq 500 system. RNA-seq reads from each sample (n=4 tumors per group) were aligned to the reference genome using STAR (version 2.5.2b). RSEM (v1.2.31), GENCODE V19 gene annotation were used to quantify gene expression, and htSeq, DESeq2 (1.22.0) for identification of differentially expressed genes (7-10).

Ingenuity Analysis

Functional analyses were generated through the use of IPA (Qiagen, Inc).

IVIS Bioluminescent imaging

At the indicated time post injection, mice were given 200 μ l luciferin (15 mg/ml) intraperitoneally. Signal was allowed to stabilize for 10 min, and mice were then anesthetized with 3-5 minutes of 1-3% isoflurane. Mice were

loaded into the Perkin Elmer IVIS machine for capture of luminescent signal (1-minute standard exposure, scale 5e4 to 5e5 radiance).

Microarray Data Accession

Microarray data used in the IPA pathway analysis was accessed through ArrayExpress (<http://www.ebi.ac.uk/microarray-as/ae/>) under the accession numbers E-MEXP-1851 (HB transcriptome), E-MEXP-1852 (HB aCGH), and E-MEXP-1853 (mouse liver) (Cairo et al, 2008).

Statistical Analysis

All statistical analyses were performed using GraphPad Prism 8.

TCGA and Microarray Analysis

For gene correlation analyses, correlation data from the TCGA HCC (n=348) data set was obtained from cBioPortal. E-MEXP-1851 (HB transcriptome) was obtained from ArrayExpress (n=25). Briefly, gene expression data were analyzed using Spearman's correlation analysis.

RNA-Sequencing Library Preparation and Analysis in hbHeps

RNA was extracted from hbHep FAH mice (n=3 mice), and control FAH-/ treated with NTBC (n=3 mice) in duplicate. Extracted RNA was prepared into sequencing libraries, and sequenced by GENEWIZ, LLC. (South Plainfield, NJ, USA). Libraries were prepared using paired end-reads, and >15 million reads per sample. Samples were first quantified using the Qubit 2.0, and Agilent Tape Station. Libraries were sequenced using Illumina Hi-seq .

RNAseq Analysis in hbHeps

Transcript quantification was performed using kallisto according to Bray et al. (<https://doi.org/10.1038/nbt.3519>) Paired-end FASTQ files were pseudoaligned (100 bootstraps setting, -b 100) to an index built with an Ensembl FASTA (all cDNA; GRCh38.p6). Gene-level transcript aggregation and statistical comparison between genes (scaled-reads-per-base) were done using sleuth. (<https://doi.org/10.1038/nmeth.4324>).

Supplemental Figure Legends

Figure S1. Establishment of YAP1 ON conditional HB model

(A-B) Representative immunohistochemistry in YAP1 OFF D3, D6 and D14 tumors, 100 µm. (C-D) H&E scale bars 25 µm, Representative immunohistochemistry in YAP1 OFF D3, and D14 tumors, 100 µm (E) in vivo immunoblot of liver lysates

Figure S2. YAP1 withdrawal promotes reduced proliferation and a mild increase in cleaved caspase-3 (CC3) in vivo.

(A-B) Representative immunohistochemistry in YAP1 ON and YAP1 OFF D6 tumors, CC3 and Ki67 respectively, n=3, Scale bars 25 µm.

Figure S3. YAP1 withdrawal promotes long term survival in mice.

(A) Representative histology and immunohistochemistry in YAP1 ON and YAP1 OFF tumors D14, D70, scale bars 25 µm H&E, scale bars 100 µm IHC. (B) Quantification of long term off relative luciferase signal, n=2, SB-rtTA mice.

Figure S4. Reactivation of YAP1 promotes tumor proliferation.

(A) Quantification of luminescent radiance, mice were treated with doxycycline for 8 weeks prior to withdrawal and monitored for 18+ weeks, n=2 SB-rtTA plasmid, n=3 Tg-rtTA not shown (B) Representative luminescent imaging in one SB-rtTA plasmid mouse. (C) Representative IHC Ki67 in SB- rtTA, (n=4 mice), Scale Bars 100 µm.

Figure S5. YAP1 OFF induces markers of hepatocyte differentiation.

(A-B) GSEA Analysis in YAP1 OFF D6 vs YAP1 ON tumors. (C-D) Fold change of gene expression in YAP1 ON vs. YAP1 OFF D6 tumors, n=4 tumors, p<0.05, Fold change>2. (E) in vivo immunoblot in Huh6 cells (F) Relative expression of liver differentiation markers in sgNT and sgYAP1 Hub6

Figure S6. Lineage Tracing of hbHeps

(A) Lineage Tracing Schematic (B) Representative in vivo luminescent imaging in one SB-rtTA plasmid mouse 8 weeks post-doxycycline withdrawal, validating lineage tracing model. The mouse was treated with doxycycline for 8 weeks prior to withdrawal. (C) H&E and immunohistochemistry from SB-rtTA mouse in (B), validating lineage tracing construct, scale bars 100 µm (D) Enhancer peak intersects shared with WT liver in YAP1 ON, YAP1 OFF D14 regressing tumor, and hbHeps YAP1 OFF D33 and D64. (E-G) Total ATAC peak intersects between hbHep cells, WT liver peaks, and YAP1 ON tumors. Not to scale.

Figure S7. Decreased enhancer occupancy in YAP1 OFF D14 compared to YAP1 ON

(A) Enhancer occupancy plots for ENCODE enhancers postnatal D0, embryonic D11.5 and mouse transcription start sites in YAP1 ON, YAP1 OFF D14 and WT liver, scale bigwig peak signal (B) Biological replicate

Figure S8. Transient increase in enhancer occupancy in hbHeps D33

(A) Enhancer occupancy plots for ENCODE enhancers postnatal embryonic D11.5 and mouse transcriptions in YAP1 ON, YAP1 OFF D14, hbHeps D33, hbHeps D64, and WT liver. YAP1 ON, YAP1 OFF D14 and WT representative sequencing data, scale bigwig peak signal

Figure S9. Decreased Tead and Fos-Jun occupancy in hbHeps D33 compared to YAP1 ON Tumors.

(A-D) ATAC-seq DNA footprints shows decreased occupancy at Tead and Fos-Jun motifs in YAP1 OFF D33 hbHeps compared to YAP1 ON

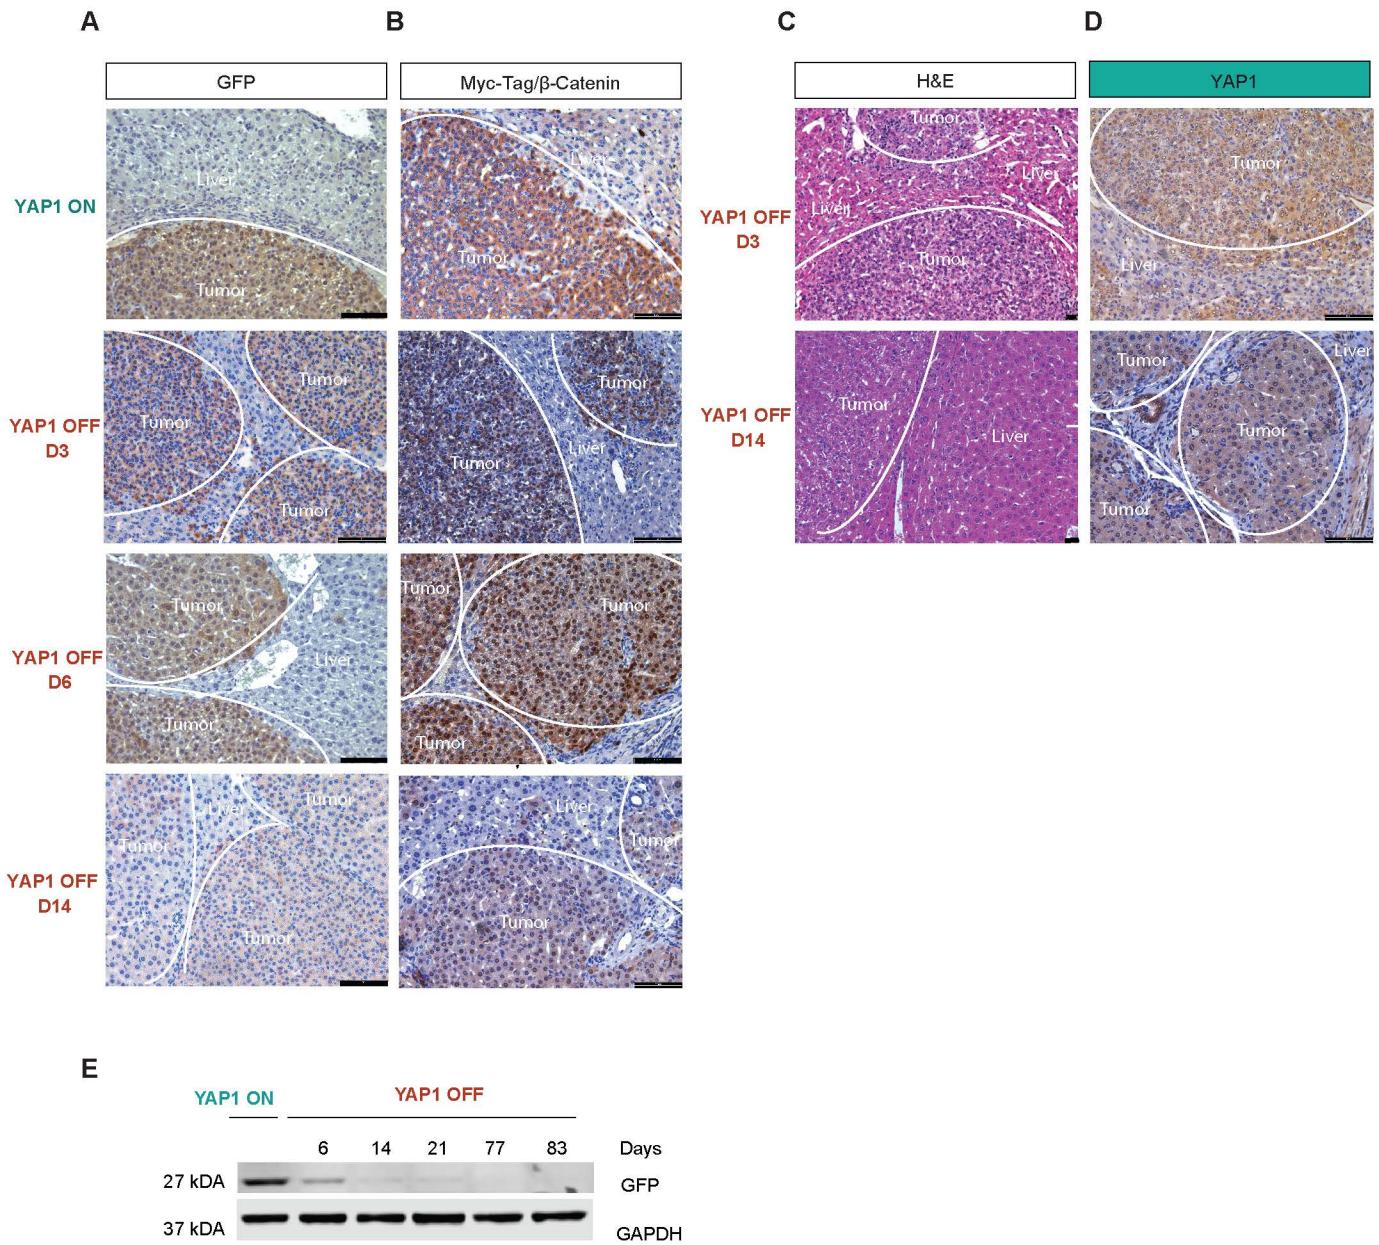

Figure S10. hbHeps D33 show increased occupancy of canonical liver differentiation transcription factors compared to YAP1 ON.

(A-D) ATAC-seq DNA footprints comparing YAP1 ON Tumor to YAP1 OFF D33 hbHeps

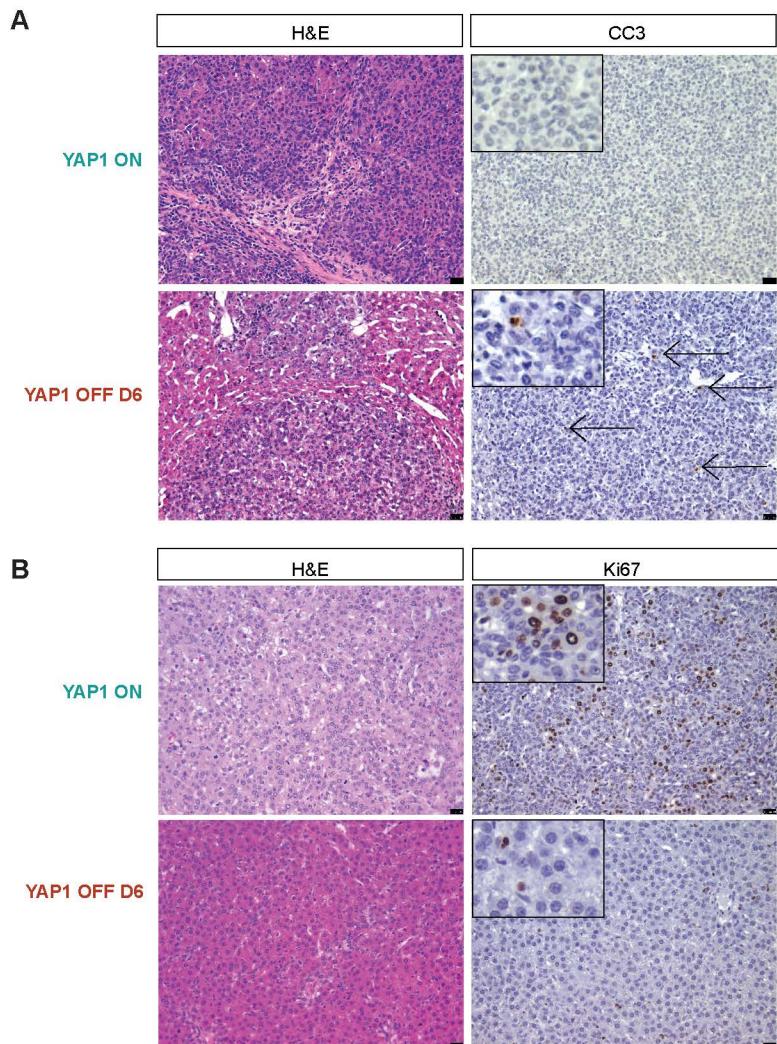

Figure S11. hbHeps partially recover hepatocyte gene expression.

(A) IPA Ingenuity analysis *Disease and Function* signatures, curated, gene expression data from YAP1 ON, YAP1 OFF D6 tumors (n=4 tumors), hbHeps D114+ (n=3 mice), WT *Fah*^{-/-} mice +NTBC (n=3 mice), scale log(p-value) for pathway signatures **(B)** Volcano plot differentially expressed genes, hbHep D114+ *Fah*^{+/+} mice vs WT *Fah*^{-/-} mice +NTBC (n=3 mice), P<0.05 **(C)** Hooks 4-gene signature shown for gene expression data from YAP1 ON , YAP1 OFF D6 tumors (n=4 tumors), hbHeps D114+ (n=3 mice), WT *Fah*^{-/-} mice +NTBC (n=3 mice) **(D)** Top 10 downregulated genes in hbHep D114+ *Fah*^{+/+} mice vs WT *Fah*^{-/-} mice +NTBC (n=3 mice) **(E)** Top 10 upregulated genes in hbHep D114+ *Fah*^{+/+} mice vs WT *Fah*^{-/-} mice +NTBC (n=3 mice) **(F-G)** Normalized reads (scaled bases per read) for select genes in YAP1 ON , YAP1 OFF D6 tumors (n=4 tumors), hbHeps D114+ (n=3 mice), WT *Fah*^{-/-} mice +NTBC (n=3 mice)
