Table S1. Expression of cell surface markers on hUC-MSCs.

The cell surface markers on hUC-MSCs were determined by flow cytometry. The hUC-MSCs positively expressed the CD44, CD73, CD90, and CD105, whereas negative expression of CD11b, CD19, CD34, CD45, and HLA-DR.

Positive Markers	Positive cells (%)
CD44	100
CD73	100
CD90	98.9
CD105	99.8
Negative Markers	
CD11b/CD19/CD34/CD45/HLA-DR	0.41

Figure S1. The change of body weight and serum level of TNF- α with CS exposure before hUC-MSC administration.

(A) The body weight was significantly decreased during the CS exposure. (B) A significant increase in TNF- α in the serum of mice after CS exposure for 4 months. The results were analyzed by an unpaired *t*-test. $n = 8 \sim 10$ per group. *p < 0.05, **p < 0.01, ****p < 0.0001.

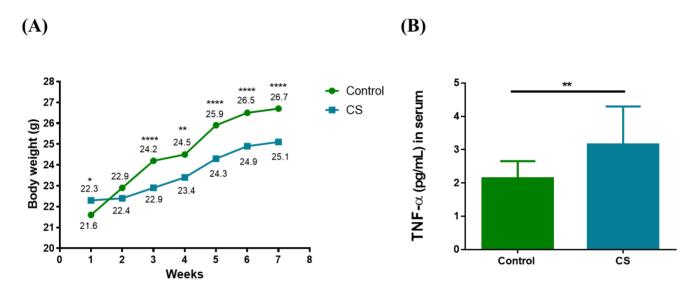

Figure S2. The body weight difference before and after 4-week hUC-MSC administration. $n = 8 \sim 10$ per group.
