

Supplemental Table 1: The terms used to search relevant publications on the relation between ALA and risk of mortality

In PubMed, Scopus, and ISI Web of Science	n
1. "Fatty Acids, Omega-3"	
2. "Omega-3"	
3. "Omega 3"	
4. "n-3 PUFA"	
5. "n-3 Fatty Acids"	
6. "n-3 Fatty Acid"	
7. "n-3 Oils"	
8. "n-3 Oil"	
9. "Unsaturated Fatty Acid"	
10. "Polyunsaturated Fatty Acid"	
11. "alpha-Linolenic Acid"	
12. "α-Linolenic Acid"	
13. "Linolenate"	
14. "Linolenic Acid"	
15. (1 OR 2 OR 3 OR 4 OR 5 OR 6 OR 7 OR 8 OR 9 OR 10 OR 11 OR 12 OR 13 OR 14)	
16. mortality	
17. death	
18. fatal	
19. survive	
20. "Neoplasms"	
21. "Cancer Survivors"	
22. "cardiovascular disease"	
23. "coronary disease"	
24. "Myocardial Ischemia"	
25. "coronary artery disease"	
26. "myocardial infarction"	
27. stroke	
28. (16 OR 17 OR 18 OR 19 OR 20 OR 21 OR 22 OR 23 OR 24 OR 25 OR 26 OR 27)	
(15 AND 28) In PubMed	5903
(15 AND 28) In Scopus	8023
(15 AND 28) In ISI Web of Science	4438
Duplicate	5991
In Google Scholar	500
"Linolenic acid" and mortality	
By searching the above combination in this engine, we screened the first 500 relevancy ranked papers to avoid missing any eligible studies.	
Total	12873

Supplemental Table 2: Characteristics of included studies on the association between ALA intake (or tissue biomarkers) and all-cause mortality in adults aged >18 years

Author	Country	Age*	Sample size	Follow up (years) ‡	Deaths	Exposure	Exposure assessment	Health status†	Median/cutoff point	RR (95% CI)	Adjustment
Lelli et al. 2019	Italy	>65	M/F: 927	9	318	Dietary intake	FFQ	Healthy	NR	1 0.83 (0.58-1.18) 0.87 (0.62-1.22) 0.84 (0.59-1.21)	Age, sex, education, BMI, estimated glomerular filtration rate (CKD-EPI), caloric intake/body weight, smoke, hypertension, diabetes, alcohol and oleic acid consumption.
						Total serum	GC		NR	1 0.77 (0.55-1.07) 0.74 (0.52-1.05) 0.75 (0.53-1.07)

Abbreviation: ROBINS-E: risk of bias in non-randomized studies of exposures

The risk of bias in non-randomized studies of exposures (ROBINS-E) tool comprises 7 domains through which bias might be introduced. The questions of these domains include: (1) bias due to confounding, (2) bias in selection of participants into study, (3) bias in the classification of exposures, (4) bias due to departure from intended exposures, (5) bias due to missing data, (6) bias in the measurement of outcomes, and (7) bias in the selection of reported results. Studies were categorized as low risk, moderate risk, serious risk, and critical risk of bias under each domain.

Supplemental Table 11: Summary risk estimates for the association between ALA and risk of mortality in adults aged ≥ 18 years¹

	#RR ²	Pooled RR (95% CI)	Baseline Risk per 10,000 Person-years ³	AR per 10,000 person-years (95% CI)	I ² (%) ⁴	P-heterogeneity ⁵
ALA and all-cause mortality						
The highest vs. lowest comparison						
Dietary ALA intake						
Random	15	0.90 (0.83-0.97)	1130	-113 (-192 to -34)	77.8	<0.001
Fixed	15	1.01 (0.99-1.03)	1130	11 (-11 to 34)	77.8	<0.001
Tissue ALA levels						
Random	15	0.95 (0.90-0.99)	1130	-57 (-113 to -11)	8.2	0.36

¹Abbreviation: ALA, α -linolenic acid; BMI, body mass index; CI, confidence interval; RR, relative risk; CVD, cardiovascular disease; AR, absolute risk

²Number of effect sizes

³Baseline risks for all-cause, CVD, and CHD mortality were obtained from the Emerging Risk Factors Collaboration that contained data from 102 international cohorts. For cancer mortality, baseline risk was based on the GLOBOCAN that described cancer incidence and mortality from 20 large areas of the world

⁴Inconsistency- the percentage of variation across studies due to heterogeneity

⁵Obtained from the Q-test

Supplemental Table 12: Relative risks and 95% CIs of mortality in different doses of ALA based on the nonlinear dose-response analysis

ALA (g/d)	All-cause mortality			CVD mortality	CHD mortality	Cancer mortality
	Total	Male	Female			
0.27-0.40	1.00 (0.27 g/d)	1.00 (0.35)	1.00 (0.35)	1.00 (0.35 g/d)	1.00 (0.40 g/d)	1.00 (0.35 g/d)

Supplemental Figure 13**

Forest plot for the association between dietary ALA intake and cancer mortality by comparing the highest and lowest intakes of ALA

**Online Supporting Material
Supplemental Figure 14**

Forest plot for the association between dietary ALA intake and cancer mortality according to a 1-g/d increase in dietary ALA

**Online Supporting Material
Supplemental Figure 15**

Forest plot for the association between tissue ALA levels and cancer mortality by comparing the highest and lowest levels of ALA

**Online Supporting Material
Supplemental Figure 16**

Forest plot for the association between tissue ALA levels and cancer mortality based on a 1-SD increase in ALA levels

**Online Supporting Material
Supplemental Figure 17**

Non-linear dose-response association of α -linolenic acid intake (based on g/day) with risk of mortality from all-cause in men and women aged ≥ 18 years. Solid line indicates the spline model. Dashed line presents the 95% CI. RR: relative risk, CI: confidence interval
