

Supplementary Table 12. Modelling hippurate urinary concentrations in function of microbiome richness and phenylpropanoid metabolism modules, enterotype, individuals' age, gender and BMI and dietary habits. Dietary habits were encoded either as food categories (N=184), or summarized in two principal components (dietary PC; N=193). The contribution of each explanatory variable in an univariate modelling of urinary hippurate is first provided (with the prefix univariate). The best model (stepwise forward selection) summary statistics are reported next with the prefix multivariate. All continuous variables were rank-transformed.

Biodi- nical variables and units	Short name	High PC1		pFDR	Low PC1		pFDR	High PC2		pFDR	Low PC2		pFDR
		Median			Median			Median			Median
