

Supplemental Figure S2 Sustained reduction of cytokine by MON-DNJ is target specific. Cytokines were assayed on a Luminex platform and analyzed for statistically significant differences as described for **Fig. 1** with collection at 72 hours (a) and 120 hours (b) p.i. for the same donors. Biological replicates ($n=5$) were assayed in technical singlicate. Discontinuous axes are used where necessary as a consequence of > 10 fold difference in level of cytokine induced by DENV and LPS. MON-DNJ (grey bars) concentration is 25 μ M. All error bars represent standard deviation. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$
