

SUPPLEMENTAL MATERIALS

Materials and methods

Specimens

Peripheral blood specimens were collected under protocols approved and overseen by the Stanford University Administrative Panel for the Protection of Human Subjects and the Stanford Cancer Institute Scientific Review Committee. The participant was counseled and gave consent for genomic sequencing studies. Peripheral blood specimens were drawn into EDTA or sodium heparin tubes for DNA-based studies, and a buffy coat was isolated. For the time point #1 specimen, granulocytes were isolated using Ficoll-Paque PREMIUM (GE Healthcare Biosciences, Pittsburgh, PA, USA) according to the manufacturer's protocol. Peripheral blood specimens were drawn into PAXgene Blood RNA tubes (PreAnalytiX GmbH, Hombrechtikon, Switzerland) for RNA-based studies. A skin punch biopsy was performed and cultured as described previously to provide the patient's germline DNA complement.¹ DNA was extracted using the Gentra Puregene Cell Kit (Qiagen, Valencia, CA, USA), and RNA was extracted using the PAXgene Blood RNA Kit (Qiagen), both according to the manufacturer's protocol.

Genome sequencing

Genome sequencing on the time point #1 sample was performed by Macrogen to achieve a mean coverage depth of 40X. Samples were prepared according to the Illumina TruSeq DNA sample preparation guide, and the libraries were sequenced using the Illumina HiSeq 2000 Sequencer. Reads were mapped by BWA against UCSC hg19. IGV was used to manually inspect the genomic coordinates corresponding to the 9p24 and 22q11.2 loci to identify discordant paired-end sequences that would suggest a genomic DNA rearrangement.

Genome sequencing on the time point #2 (pre-ruxolitinib specimen), time point #4 (blast transformation specimen), and skin samples was performed by Macrogen (ver. MGX-WGS-0101-M) to a mean depth of 40X. In brief, samples were prepared according to the Illumina TruSeq Nano sample preparation guide, and the libraries were sequenced using the Illumina HiSeq X Ten Sequencer to generate 150-bp paired-end reads. Reads were aligned to UCSC hg19 using BWA, and somatic SNVs in time points #2 and #4 were called by MuTect, following best practices, using the cultured skin fibroblasts as the germline comparison.² Potential coding variants that were present in time point #4 but not time point #2 were manually curated as discussed in the below paragraph.

Variants identified by the MuTect pipeline were manually inspected if they resulted in a non-synonymous coding change or involved the invariant 2 bases of the donor or acceptor splice site. Integrative Genomics Viewer was used to review the read sequence, base quality scores, and mapping scores across time point #2, time point #4, and skin specimens. The genomic context of the variants regions was further examined using UCSC Genome Browser (<http://genome.ucsc.edu/>). Features that were generally used to exclude potential variants for further consideration included: 1) 3 or less variant reads in time point #4, 2) variant reads present on only one strand, 3) involves a region of the genome with one or more highly homologous regions, 4) mutant reads observed in time points #2 and #4, and 5) common SNPs ($\geq 1\%$ minor

allele frequency, map uniquely, no “clinically associated” flag). All variants that passed manual inspection were confirmed by Sanger sequencing.

RNA sequencing

RNA sequencing was performed from RNA isolated from the time points #2 and #3. Samples were prepared using the Illumina TruSeq Stranded mRNA Library Prep Kit, following the manufacturer’s protocol. Two independent libraries were generated for each time point, and at least 25M reads were generated for each replicate (i.e., at least 50M reads for each time point). Samples were sequenced on the HiSeq 2000 with a 2x101bp configuration.

We used GRCh37 transcriptome reference as index and salmon v0.8.2³ to quantify gene expression from fastq files at time points #2 and #3 using 8 cores. Differential expression between time points was performed using DESeq2 version 1.10.1⁴. We followed the DESeq2 pipeline to generate the results. In brief, we filtered out genes for which less than 10 counts were observed across samples. Data was then corrected for library size; dispersion was estimated and effects were tested after fitting a negative binomial GLM and obtaining Wald statistics. Results were provided at FDR of 1%. Differentially expressed genes at time point #3 versus time point #2 are provided in **Supplemental Table S2** for all genes with a p.adjusted <0.01.

Mate pair sequencing (MPseq)

MPseq library preparation methods have been previously described⁵⁻⁷. Briefly, DNA was processed using the Illumina Nextera Mate Pair library preparation kit (Illumina) and sequenced on the Illumina HiSeq 2500 in rapid run mode. Pooled libraries were hybridized onto a flow cell (2 samples per lane) and sequenced using 101-basepair reads and paired end sequencing. Sequencing data was mapped to the reference genome (GRCh38) using BIMA⁸ and the output analyzed using SVAtools in order to detect structural variants (SVs) and large genomic alterations (>30Kb) that involve breakpoint junctions and/or copy number alterations (CNAs). The breakpoint locations of both junctions and CNAs are reported⁵⁻⁷ and graphically illustrated using genome, junction and region plots as previously described⁹.

Chromosomal Microarray

Whole genome chromosome microarray (CMA) was performed on the CytoScanHD microarray platform (ThermoFisher Scientific, Waltham, MA). DNA is processed through enzymatic digestion, adapter ligation, PCR, magnetic bead purification of PCR products, fragmentation into 25-100bp DNA segments, and biotinylation. Biotinylated DNA hybridizes onto a CytoScanHD array, washed and stained in a GeneChip® Fluidics Station 450, and scanned in a GeneChip® scanner using the CytoScanHD_Array_450 protocol. The resulting data were analyzed using Chromosome Analysis Suite (ChAS) version 3.3.

Supplemental Figures

Figure S1. FISH analysis. Sequential metaphase FISH was performed on a previously G-banded metaphase (left panel). FISH was performed using the dual-fusion BCR/ABL1 probe (Abbott; ABL probe = red, BCR probe = green) to examine the *BCR* locus (right panel). Consistent with this representative image, all five metaphases examined by sequential FISH demonstrated that the green BCR signal was only observed on the short arm of the derivative chromosome 9 at approximately 9p24 (solid arrow). The BCR signal was not observed on the derivative 22 (hollow arrow). These findings are consistent with the entire *BCR* locus being present on the derivative 9. This finding suggested that either: (1) The *BCR* locus is not involved in the t(9;22)(p24;q11.2) observed in this case. Rather, another region on 22q11.2, or nearby, is involved, or (2) This represents a more complex structural rearrangement. Subsequent studies demonstrated that the latter had occurred in this case.

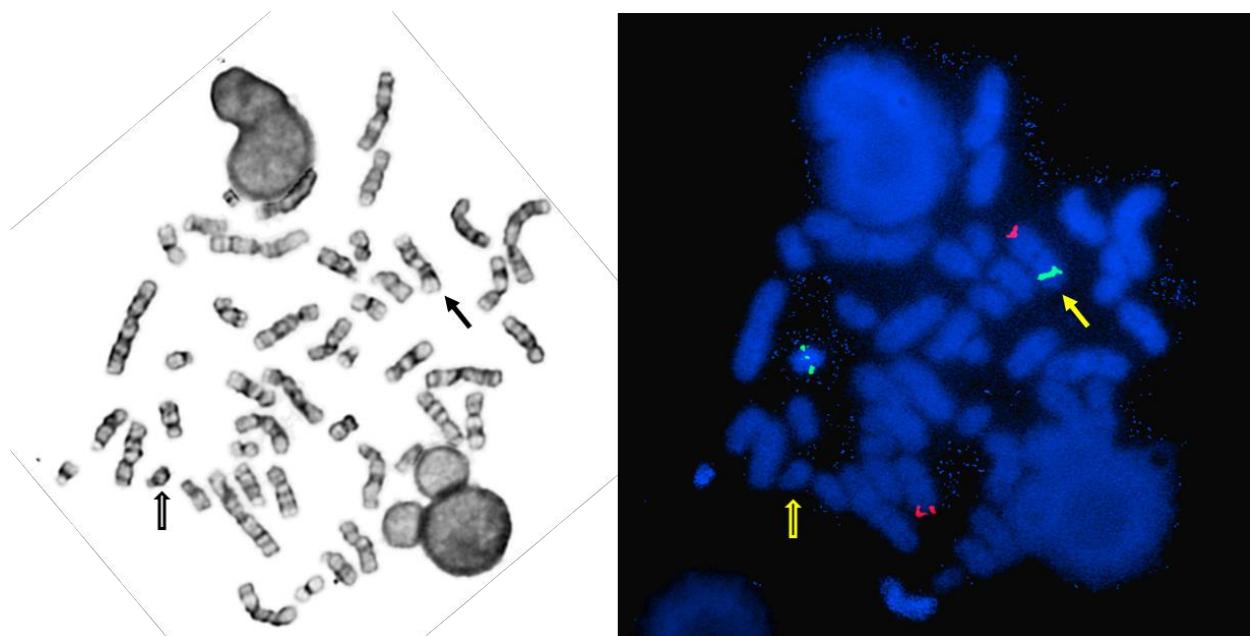

Figure S2. Observed RNA fusions. Reverse transcription PCR (RT-PCR) demonstrated an in-frame fusion between exon 1 of *BCR* (NM_004327.4) and exon 19 of *JAK2* (NM_004972.3). RT-PCR also identified a fusion between exon 16 of *JAK2* and exon 2 of *PPM1F* (NM_014634.4); however, this results in the introduction of a stop codon at the first complete *PPM1F* codon. A *PRAMENP/BCR* fusion transcript was not detected.

BCR/JAK2

JAK2/PPM1F

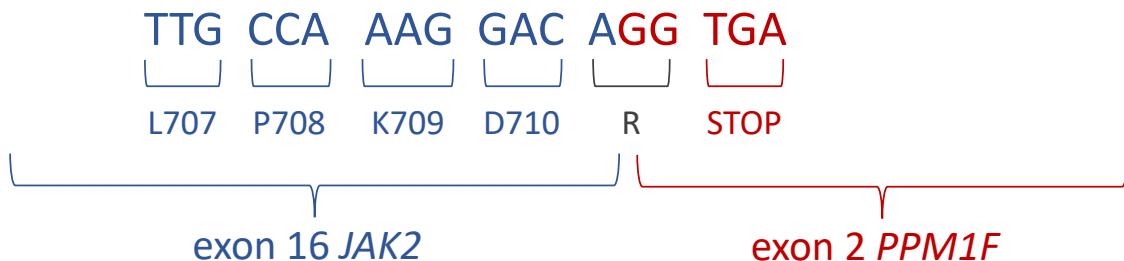

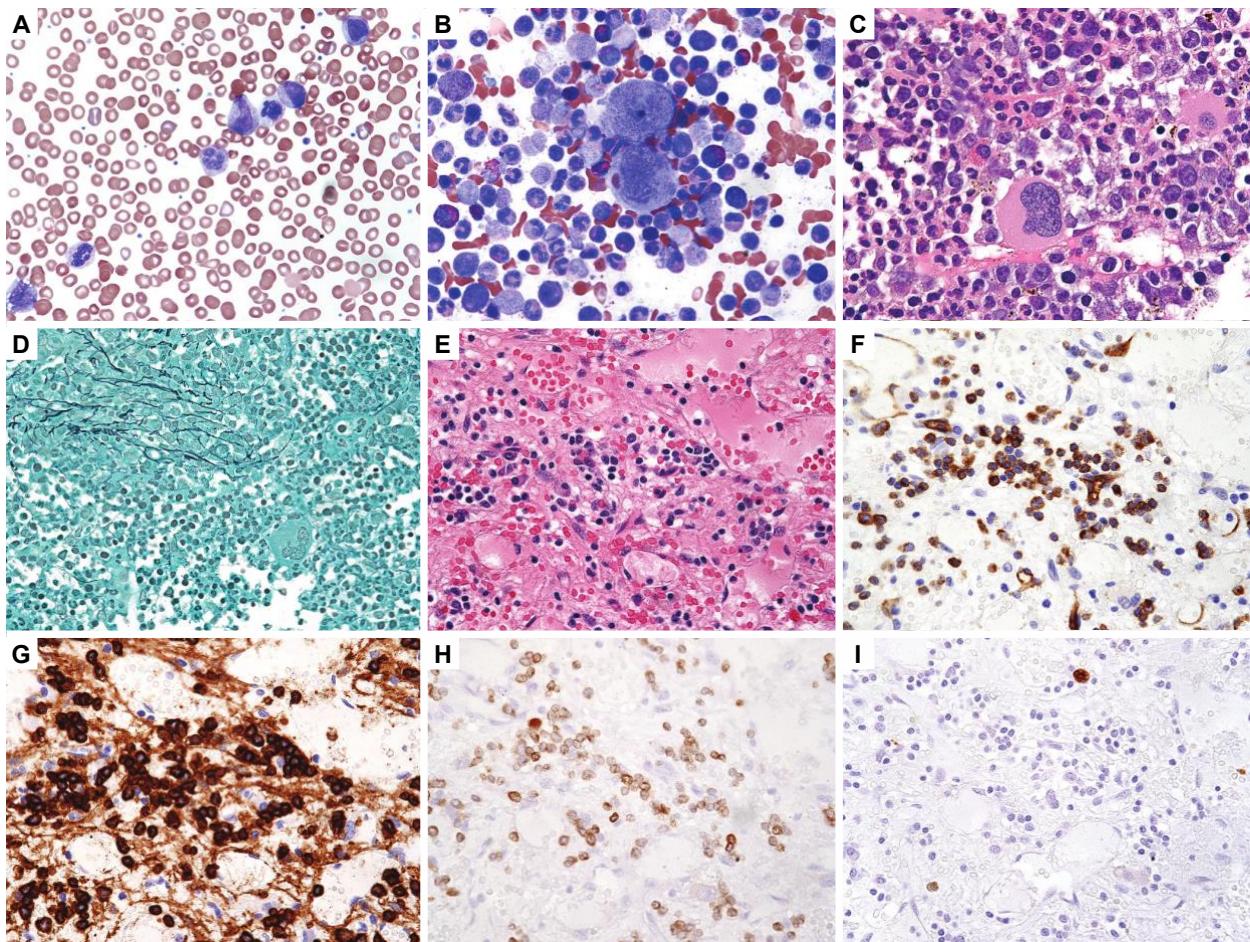

Figure S3. Peripheral blood and bone marrow histology and immunohistochemistry prior to ruxolitinib (A-D) and at blast transformation (E-I). Hydroxyurea had been discontinued two and a half weeks prior to pre-ruxolitinib sample collection (A-D). **A)** Peripheral blood showed a marked leukocytosis with myeloid predominance and left-shift but no increase in blasts. **B)** Bone marrow aspirate and **C)** core biopsy showed a hypercellular (80%) marrow with mild myeloid hyperplasia ($M:E = 4:1$), left-shift, but no increase in blasts (blasts = 0%). Micromegakaryocytes were seen with occasional multinucleation. **D)** A reticulin stain demonstrated minimal patchy fibrosis, but no collagen fibrosis was noted. **E)** At blast transformation, the bone marrow core biopsy showed patchy (0-70%, average 40%) cellularity with clusters of blasts. Immunohistochemistry demonstrated that blasts were positive for **F)** CD34, **G)** CD10, and **H)** CD79a. **I)** Immunohistochemistry demonstrated that blasts were negative for MPO. Peripheral blood image (A) was taken at 60X; bone marrow aspirate and biopsy images (B-I) were taken at 40X.

Supplemental Tables

Table S1. Genomic DNA (gDNA) and RNA fusion breakpoints. The *BCR/JAK2*, *JAK2/PPM1F*, *PRAMENP/BCR* gDNA breakpoints were identified by genome sequencing and then confirmed by Sanger sequencing. RNA fusion breakpoints were confirmed by RT-PCR.

Gene fusion	Genomic DNA breakpoint 1	Genomic DNA breakpoint 2	RNA fusion breakpoint 1	RNA fusion breakpoint 2
<i>BCR/JAK2</i>	GGAACACAATTAGCCCCTAAACT/	/AGTTTGGGTTCTTAATTATAGAA	GAGGGCGCCTCCATGGAGACGCAG/	/ATTATGAACCTAAACAGAAAATGA
