

Figure S1. The primary human osteoblasts were transfected with applied miRNA mimics (500 nM each for 24h, two rounds) or the non-sense control miRNA mimic ("miRC", 500 nM for 24h, two rounds), expression of *PGK1* mRNA was shown. Data were presented as mean \pm standard deviation (SD, n=5). * $P < 0.05$ versus "miRC" cells.
