Supplementary Figure 1. Additional measures of blood or liver toxicity. A,B) Tumor-free BALB/c mice were injected with 1×10^7 ID Salmonella, and control mice were injected with saline ($n = 4$). After 14 days, whole blood was isolated by percutaneous cardiac puncture. Comprehensive hematology (**A**) and chemistry profiling (**B**) was conducted by *Idexx Laboratories* (Grafton, MA). No differences were detected for any measurement of blood or liver toxicity. Abbreviations are BUN, blood urea nitrogen; HCT, hematocrit; HGB, hemoglobin; and MCHC, mean corpuscular hemoglobin concentration. Data are shown as means \pm SEM.

Supplementary Figure 2. Biodistribution of *CT Casp-3* Salmonella at 6 hours and 7 days. Tumor-free male C57BL/J mice were intravenously injected at 22 weeks of age with either saline (control), 1×10^7 CFU/mouse of ID Salmonella, or 1×10^7 CFU/mouse of *CT Casp-3* Salmonella with ($n = 10$ for both time points). **A**) After 6 h, tissues were excised and weighed: spleen, liver, lung, kidney, heart, brain and serum. Organs were minced and cultured on agar plates. The bacterial density in the tumors of tumor-bearing mice (from Figure 5b) at 72 h is provided as a reference. No bacteria were detected in saline controls. **B**) After 7 days, bacterial density was determined from an additional set of identically treated mice. No bacteria were detected in most of the organs. The bacterial density in the spleens of mice treated with *CT Casp-3* Salmonella was close to the detection limit. The presence of bacteria in healthy organs is common six hours after intravenous injection (as seen in a). At this time, bacteria are still present in the blood in these organs. Because the bacteria do not interact with the tissues, no adverse effects were seen (as shown in Figures 5c-e, S1 and S4). With time, the immune system clears the bacteria from the blood and organs, typically within 24 h, as can be seen by the lack of bacteria in most organs after 7 days (b). Data are shown as means \pm SEM.

Supplementary Figure 3. Efficacy of ID Salmonella delivery of NIPP1-CD. *NIPP1-CD* Salmonella (1×10^7 CFU/mouse) were administered to BALB/c mice with subcutaneous 4T1 tumors by intravenous injection. No difference in tumor volume was observed between NIPP1-CD ($n = 5$) and saline controls ($n = 4$). Data are shown as means \pm SEM.

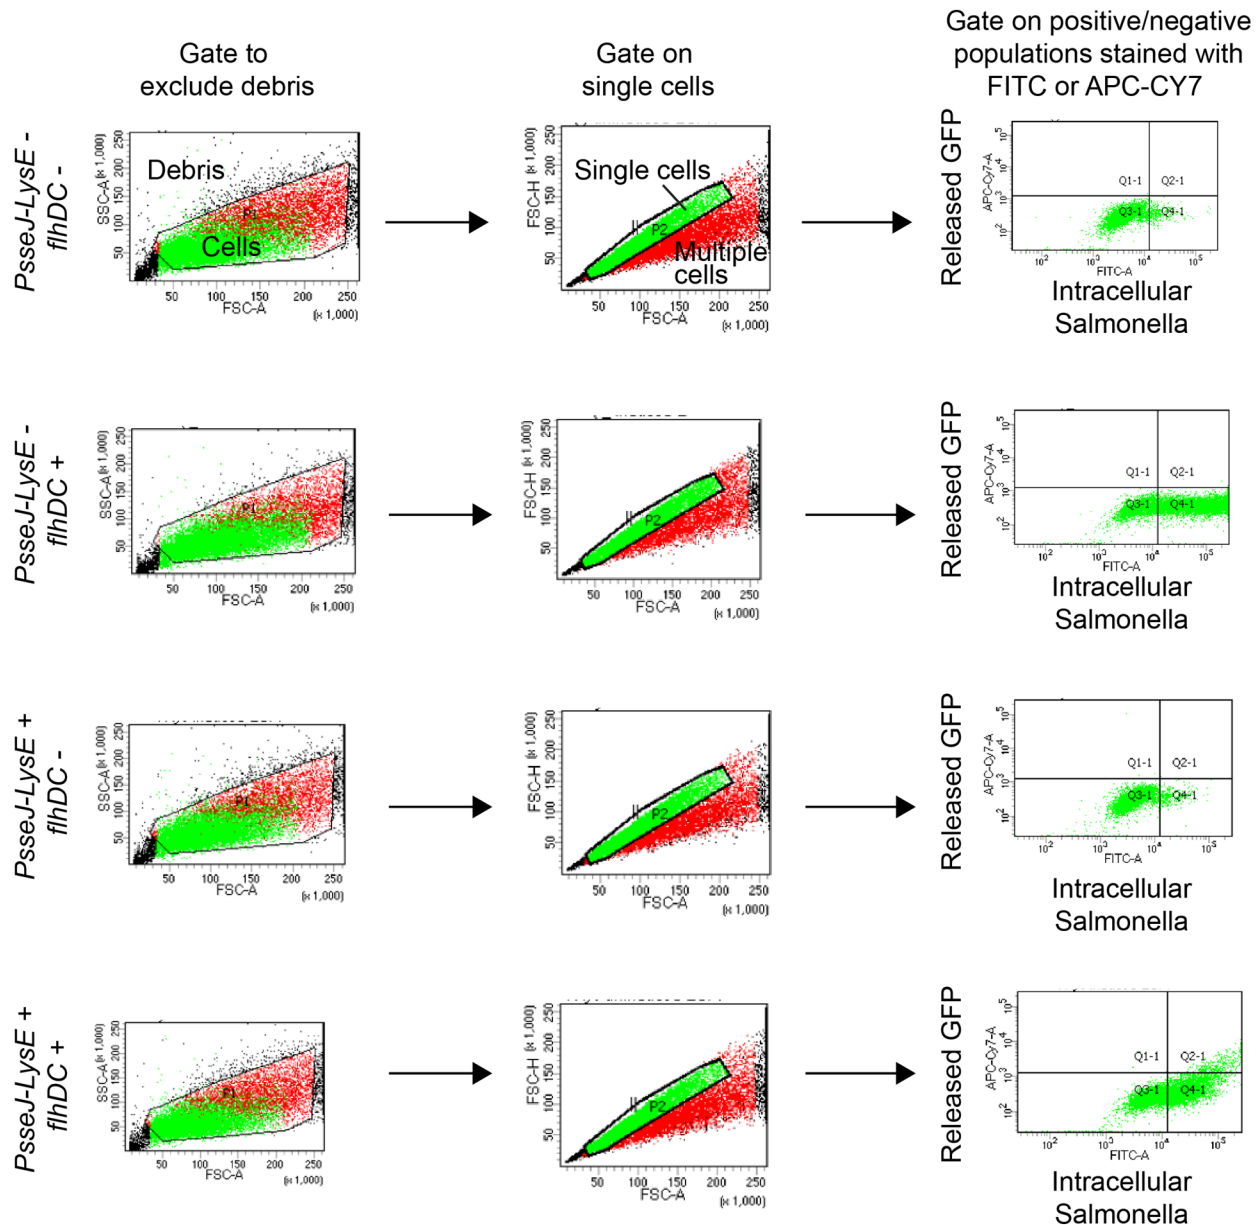

Supplementary Figure 4. Toxicity of ID Salmonella with CT Casp-3. **A)** Chemistry profiling of the blood drawn from tumor-free male C57BL/J mice ($n = 4$). Mice were intravenously injected at 22 weeks of age with either saline (control), 1×10^7 CFU/mouse of ID Salmonella, or 1×10^7 CFU/mouse of ID Salmonella with CT Casp-3. Sera were collected seven days after injection and chemistry profiling was conducted by *IDEXX Laboratories* (Grafton, MA). No differences were detected for any measurement of liver toxicity. Markers of liver damage are ALP, alkaline phosphatase; ALT, alanine transaminase; and AST, aspartate transaminase. **B)** Additional measures of liver toxicity of the blood from the mice in (A). No differences were detected for any measurement. BUN is blood urea nitrogen. Data are shown as means \pm SEM.

Supplementary Figure 5. CT Casp-3 Salmonella prevented growth of metastases in individual mice. Lung metastases were formed in BALB/c mice by intravenous injection of 5×10^4 luciferase-expressing 4T1 cells (see Figure 7G). Mice were treated with either 1×10^7 CFU of CT Casp-3 Salmonella or 10 mg/kg paclitaxel ($n = 6$). Metastatic volume was measured with bioluminescence imaging after IP injection of 100 μ l of 30 mg/ml D-luciferin, and is reported relative to initial volume. Metastases grew exponentially in three mice treated with paclitaxel, but did not grow in any mice treated with CT Casp-3.

Supplementary Figure 6. Tumor growth rate. In C57L/J mice with subcutaneous Hepa 1-6 liver tumors (Figure 7I-J), treatment with *CT Casp-3* Salmonella significantly reduced tumor growth rate compared to both saline and bacterial (ID Salmonella) controls (*, $P = 0.027$; $n = 3$). Data are shown as means \pm SEM. The statistical comparison is a two-tailed, unpaired Student's *t* test. The asterisk (*) indicates significance of $P < 0.05$.

Supplementary Figure 7. Flow cytometry gating strategy. IDf+ Salmonella were administered to 4T1 cancer cells (see Figure 4B). Four different conditions were investigated: IDf+ Salmonella without *Pssej-LysE* and without arabinose induction of *PBAD-flhDC* (*Pssej-LysE* -, *flhDC* -); without *Pssej-LysE* and with induction of *PBAD-flhDC* with 20 mM arabinose (*Pssej-LysE* -, *flhDC* +); with *Pssej-LysE* and without induction (*Pssej-LysE* +, *flhDC* -); with *Pssej-LysE* and with induction (*Pssej-LysE* +, *flhDC* +). After invasion and delivery, the 4T1 cells were harvested, fixed and stained for *Salmonella* (FITC) and myc-tagged GFP (Dylight 755; APC-CY7). The gating strategy for each condition is shown. Cells were first gated to exclude debris and then gated on single cells. FITC and APC-CY7 gates were used to quantify the percentage of cells with intracellular *Salmonella* and released GFP-myc, respectively. The four rightmost plots are the images in Figure 4B of the manuscript.

Supplementary Table 1. Bacterial strains

Strain	Background / Knockouts	Plas mid	Genetic functions	Description
<i>Parental (Par)</i>	$\Delta msbB$, $\Delta purI$, Δxyl , Δasd	-	-	Non-pathogenic therapeutic Salmonella; deletion of <i>asd</i> enables balanced lethal system to maintain plasmids in vivo
$\Delta flhD$ Sal	$\Delta flhD$ Par	-	-	Parental Salmonella with <i>flhD</i> deletion; non-motile
Intracellular reporting	<i>Par</i>	P1	<i>PsseJ-GFP</i>	Intracellularly inducible GFP
<i>flhDC</i> Sal	$\Delta flhD$ Par	P2	<i>PBAD-flhDC</i> <i>Plac-GFP</i>	Re-expresses <i>flhDC</i> after induction with arabinose Constitutively expresses GFP
<i>flhDC</i> reporting	$\Delta flhD$ Par	P4	<i>PBAD-flhDC</i> <i>PsseJ-GFP</i>	Re-expresses <i>flhDC</i> after induction with arabinose Intracellularly inducible GFP
<i>PsifA</i>	<i>Par</i>	P5	<i>PsifA-GFP</i>	Expresses GFP after activation of <i>PsifA</i> promoter
<i>PBAD-LysE</i>	<i>Par</i>	P6	<i>PBAD-LysE</i>	Bacteria lyse after activation with arabinose
ID Sal	<i>Par</i>	P7	<i>PsseJ-LysE</i> <i>Plac-GFP</i>	Bacteria lyse after activation of <i>PsseJ</i> promoter Constitutively expresses GFP
$\Delta sifA$ ID Sal	$\Delta sifA$ Par	P7	<i>PsseJ-LysE</i> <i>Plac-GFP</i>	Predominantly accumulates in the cytoplasm of cells Lyses after invasion Constitutively expresses GFP
$\Delta sseJ$ ID Sal	$\Delta sseJ$ Par	P7	<i>PsseJ-LysE</i> <i>Plac-GFP</i>	Predominantly accumulate in SCVs Lyses after invasion Constitutively expresses GFP
IDf+ Sal	$\Delta flhD$ Par	P8	<i>Plac-GFP</i> <i>PBAD-flhDC</i> <i>PsseJ-LysE</i>	Re-expresses <i>flhDC</i> after induction with arabinose Lyses after invasion Constitutively expresses GFP
<i>ID Sal-luc</i>	<i>Par</i>	P9	<i>PsseJ-LysE</i> <i>Plac-GFP</i> <i>Plac-luc</i>	Bacteria lyse after activation of <i>PsseJ</i> promoter Constitutively expresses GFP and luciferase
<i>NB</i>	<i>Par</i>	P10	<i>PsseJ-LysE</i> <i>PBAD-nano</i> <i>Plac-GFP</i>	Lyses after invasion Controllably expresses nanobody against β -actin

				Constitutively expresses GFP
<i>NIPP1-CD Sal</i>	<i>Par</i>	P11	<i>PsseJ-LysE</i> <i>Plac-NIPP1</i> <i>Plac-GFP</i>	Lyses after invasion Constitutively expresses NIPP1- CD and GFP
<i>CT Casp-3 Sal</i>	<i>Par</i>	P12	<i>PsseJ-LysE</i> <i>PBAD-</i> <i>Casp3</i> <i>Plac-GFP</i>	Lyses after invasion Controllably expresses CT Casp-3 Constitutively expresses GFP

Supplementary Table 2. Plasmids

No.	Name	Origin	Gene Maintenance	Gene Circuits	Purpose
P1	Intracellular reporting	ColE1	Chlor ^a ASD ^b	<i>PsseJ-GFP</i>	Expresses GFP after cell invasion
P2	<i>flhDC</i> re-expressing	ColE1	Amp ASD	<i>PBAD-flhDC</i> <i>Plac-GFP-myc</i>	Re-expresses <i>flhDC</i> ; Constitutively expresses GFP
P3	<i>PBAD-flhDC</i>	ColE1	Amp ^c	<i>PBAD-flhDC</i>	Used in construction of P2
P4	<i>flhDC</i> reporting	ColE1	Amp	<i>PBAD-flhDC</i> <i>PsseJ-GFP-myc</i>	Measures invasion after <i>flhDC</i> re-expression
P5	<i>PsifA</i> reporter plasmid	ColE1	Chlor ASD	<i>PsifA-GFP</i>	Expresses GFP after activation of <i>PsifA</i> promoter
P6	Inducible lysis	ColE1	Chlor ASD	<i>PBAD-LysE</i>	Lyses after activation with arabinose
P7	Intracellular lysis	ColE1	Chlor ASD	<i>PsseJ-LysE</i> <i>Plac-GFP-myc</i>	Bacteria lyse after invasion; Constitutively expresses GFP
P8	Intracellular lysis and induced invasion	ColE1	AMP ASD	<i>PsseJ-LysE</i> <i>PBAD-flhDC</i> <i>Plac-GFP-myc</i>	Lyses after invasion; Re-expresses <i>flhDC</i> ; Constitutively expresses GFP
P9	Luciferase	ColE1	Chlor ASD	<i>PsseJ-LysE</i> <i>Plac-GFP-myc</i> <i>Plac-luc</i>	Bacteria lyse after invasion; Constitutively expresses GFP and luciferase
P10	Nanobody	ColE1	AMP ASD	<i>PsseJ-LysE</i> <i>PBAD-nano-flag</i>	Lyses after invasion; Expresses flag-tagged nanobody against β -actin
P11	NIPP1-CD	ColE1	Chlor ASD	<i>PsseJ-LysE</i> <i>Plac-NIPP1</i>	Lyses after invasion; Expresses NIPP1-CD
P12	CT Casp-3	ColE1	AMP ASD	<i>Plac-GFP</i> <i>PsseJ-LysE</i> <i>PBAD-Casp-3</i>	Lyses after invasion; Constitutively expresses GFP; Expresses CT Casp-3

^aChloramphenicol

^bASD (aspartate-semialdehyde dehydrogenase) is an essential enzyme for lysine synthesis and is necessary for the synthesis of peptidoglycan⁴. It is the key gene in the balanced lethal system developed by Nakayama et al.⁵ to maintain genes in *Salmonella* after injection in vivo.

^cAmpicillin
