

FIG S2. Intratracheal GH therapy is well tolerated by mice. Body temperature of immunocompetent BALB/c mice following intratracheal treatment with the indicated single doses of (A) Sph3_h, (B) PelA_h, or (C) Ega3_h-Pp. Points represent the body temperature of ≥ 5 mice per group. ns indicates no significant difference in the change in body temperature of mice treated with 500 μg GH relative to buffer-treated mice as determined by two-way ANOVA with Dunnett's multiple comparisons test.
