

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

ABSTRACT

Introduction

People with epilepsy (PWE) have a higher mortality rate than the general population. Epilepsy related deaths have increased despite all-cause mortality decreasing in the general population pre-Covid-19. We hypothesized that clinical and lifestyle factors may identify people more at risk.

Methods

We explored factors associated with mortality using primary care population data from 01/04/2004 to 31/03/2014. Data was obtained from the Clinical Practice Research Datalink (CPRD) which compiles anonymised patient data from primary care in the UK. Cause of death data was supplemented from the Office of National Statistics when available.

Results

The analysis included 70,431 people with epilepsy, with 11,241 registered deaths. The number of deaths within the database increased by 69% between the first and last year of the study. Epilepsy was considered as a contributing cause in approximately 45% of deaths of PWE under 35. Factors associated with increased risk of death included attendance at emergency departments and/or emergency admissions (OR: 3.06 CI: 2.83–3.31), anti-epileptic drug (AED) polytherapy (2 AEDs: OR 1.69 CI: 1.58–1.79; 3 AEDs: OR: 2.23 CI: 2.01–2.48; 4+ AEDs: OR: 2.94 CI: 2.50–3.46), status epilepticus (OR: 2.62 CI: 1.54–4.45), depression (OR: 1.67 CI: 1.57–1.77) and injuries (OR: 1.40 CI: 1.30–1.51). No seizures in the prior year (OR: 0.77 CI: 0.70–0.86) and an increased frequency of collecting repeat epilepsy prescriptions (OR: 0.57 CI: 0.51–0.64) was associated with a lower risk of mortality.

Conclusion

Our results add to existing evidence that deaths in epilepsy are increasing. Future studies could focus on identifying PWE at high risk during routine consultations and addressing them with clinical interventions or better self-management. Identifying risk factors for younger people should be a priority as epilepsy may be a factor in close to half of deaths of PWE under 35 years of age.

STRENGTHS AND LIMITATIONS OF THE STUDY

- The study examines the higher mortality rate in epilepsy by exploring risk factors that could be mitigated by interventions in clinical practice
- The study included data collected in primary care which is large and representative compared to hospital data
- The large sample size collected from participating UK practices contributes to the generalisability of the results
- The data set used was from 2004 to 2014, as this covered a period where epilepsy was part of a national programme for outcome reporting.

For peer review only

INTRODUCTION

Epilepsy is one of the most common neurological conditions with about 50 million people affected worldwide.¹ With access to good treatment, it is estimated that 60-70% of people with epilepsy (PWE) can become free of seizure.² However, epilepsy is also an important cause of premature death.³ Mortality rates of people with epilepsy are higher than for the general population.⁴⁻⁹ A longitudinal cohort study from Sweden found that an epilepsy diagnosis was associated with a 14-fold increased risk of all-cause death.⁵ Some studies suggest that this has not changed over time.^{4 10} Other data suggest the number of deaths in PWE is increasing despite a decrease in all-cause mortality in the general population.^{8 11 12} Public Health England reported that deaths with epilepsy as a contributing factor increased by 70% between 2001 and 2014, while all-cause deaths in the population decreased by 6%.¹¹

Some causes of death in PWE are similar to the general population, such as circulatory and respiratory diseases, dementia, Alzheimer's and cancers.^{11 13 14} Others are related to consequences of the condition itself such as injuries, burns and drowning during seizures.^{5 9 15} Lifestyle and psychosocial factors contribute to increased risk of mortality and include alcohol or substance misuse,^{13 16} low adherence to medication,¹⁰ depression,^{5 16} and socioeconomic status.^{11 16} Sudden unexpected death in epilepsy (SUDEP) is sometimes posited as a common cause of death for PWE. A recent review suggests SUDEP accounts for 12% of all-cause deaths in epilepsy.¹⁰ However, factors that can be prevented or treated are under-researched and could lead to more impact on reducing mortality.

In 2011, our group published risk factors increasing mortality in PWE based on population data collected in primary care in the United Kingdom (UK) between 1993 and 2007.¹⁶ Here, we follow-up on the analysis using data collected during an incentivised programme which rewarded enhanced monitoring and care for people with epilepsy in primary care over ten years. We hypothesised that the epilepsy data collected under this programme would be of high quality allowing for a comprehensive analysis of causes and risk factors associated with mortality. We report the number of deaths recorded during this time, the causes of death for younger and older PWE, and risk factors associated with mortality among PWE.

METHODS

Study Design

A retrospective cohort design was used to analyse mortality and causes of death in PWE. Risk factors affecting mortality were analysed using a nested case-control study. This study was approved by the Independent Scientific Advisory Committee of the Medicine and Healthcare Regulatory Agency (protocol 17_208R2).

Setting

Data was obtained from the Clinical Practice Research Datalink (CPRD). This database contains anonymised patient data obtained from electronic records from primary care clinics in the UK. The data is sent from participating clinics to a central server where data is cleaned, checked for quality and curated. A study from 2015 counted 11,299,221 patients registered in the CPRD from 674 GP practices.¹⁷ Patients in the database were representative of the UK population when compared to the 2011 census.¹⁷ For our study period, mid-year counts for 2004 show 4,584,065 patients were active in the database (alive and currently registered in a GP practice) with 50.1% being female. In 2013, 4,493,034 patients were active at mid-year and 50.4% were female.

1
2
3
4
5 Cause of death information was obtained when available through linked data for a subset of patients
6 from England and Wales from the Office of National Statistics (ONS). The cause of death is presented
7 using ICD-10 diagnostic codes and offers the main cause and up to 15 contributing causes, if
8 applicable. The Index of Multiple Deprivation (IMD) was also obtained for each patient's GP practice,
9 which was used for control matching in the case-control study. Practice IMD data was "most up to
10 date" version when requested in 2018.
11
12

13 Our study period was from 01/04/2004 to 31/03/2014 during which epilepsy came under the Quality
14 and Outcomes Framework, a programme implemented within the primary care setting. The aim of the
15 programme was to record clinical information on specific lifestyle items or health conditions with the
16 view that structured monitoring and reporting improved the quality of care.¹⁸
17

18 **Cohort study participants**

19
20 For the mortality and cause of death cohort study, adults with epilepsy were included who were least
21 18 years old at time of death. Epilepsy was defined as having a documented epilepsy diagnostic code
22 and at least two prescriptions of antiepileptic drugs (AEDs). Any patient with a diagnostic code of
23 "epilepsy resolved" was removed from the study (Medcodes 8385 and 12848).
24
25

26 **Case-control study participants**

27
28 For the analysis of factors associated with mortality, cases were defined as PWE with a documented
29 date of death between 01/04/2004 to 31/03/2014 with at least 12 months of data recorded in our
30 study period (thus earliest data of death included was 01/04/2005). Controls were randomly matched
31 at a ratio of 3:1 by sex, practice IMD, year of birth (+/- 1 year). For cases aged 18, controls were
32 matched for year of birth + 1 year. Controls were alive for at least 12 months after the date of death
33 of their matched case.
34

35 **Exposure variables**

36
37 Potential variables were selected based on existing literature, items part of the QOF and others
38 associated with lifestyle. Exposure data were refined based on the availability and reliability of data in
39 the CPRD. Description of variables and sources of data are included in the Supplemental File. We
40 assessed variables occurring in the 12 months prior to the case's date of death for emergency
41 department visits or emergency admissions, number of AEDs, status epilepticus, depression, injury,
42 smoking status, seizure freedom, and prescription adherence. Prescription adherence for 12 months
43 was established using Therapy data which records dates of repeat prescriptions as requested by GPs.
44 History of co-morbidity was taken from all available patient data for dementia and stroke. Missing
45 data was considered as "no" for binary outcomes except for smoking status where the last known
46 status was used, as previously reported.¹⁹ Variables that were considered but not included due to poor
47 quality of data included alcohol and substance use.
48
49

50 **Statistics**

51
52 The number all-cause deaths recorded in the CPRD was calculated for complete calendar years (from
53 2005 to 2013) to allow for comparisons with previous publications. All other analyses used data from
54 the full study period (01/04/2004 to 31/03/2014). The cause of death data was analysed two ways: 1)
55 tabulating the main cause of death in PWE and 2) evaluating the proportion of deaths with epilepsy
56 listed as a contributing cause. A contributing cause was defined as either the main cause or listed as a
57 cause in any of the other 15 positions on the death certificate. The main causes of death are presented
58
59
60

for younger and older PWE with 65 years as the cut-off. Deaths with epilepsy as a contributing cause were divided by age group. To track trends, an additional analysis of main cause of death by full calendar year is presented in supplemental material.

Conditional logistic regression was used for the nested case-control study. Variables were included in the model following maximum likelihood and Akaike information criterion (AIC) testing. Potential confounders such as age, sex, and deprivation were addressed by control matching. Data are presented as odds ratios (ORs) and 95% confidence intervals.

Patient and Public Involvement

No patient involved.

RESULTS

We obtained a sample size of 70,431 PWE with 11,241 who had a documented date of death within our time frame (Figure 1). We obtained cause of death for 7,405 people from ONS linked data. Age of patients ranged 18 to 105 with 50.8% male.

Number of deaths

The number of deaths recorded in the database increased between 2005 to 2013, from 821 to 1,386 which represents a 68.8% increase (Table 1). This increase was not attributed to more PWE being registered in the database as this decreased by 21.8% over the same period. The mean age of the participants within the database increased over time.

Table 1. Number of recorded deaths of PWE in the CPRD per full year within the study period.

| | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 |
|--|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| Average age of adult PWE in the database, mean (SD) | 48.7 (18.5) | 49.0 (18.6) | 49.3 (18.6) | 49.6 (18.6) | 49.9 (18.6) | 50.2 (18.6) | 50.5 (18.6) | 50.8 (18.6) | 51.2 (18.6) |
| Number of PWE registered in the database | 48,447 | 48,585 | 48,031 | 46,948 | 45,941 | 44,485 | 42,521 | 40,120 | 37,865 |
| Number of recorded deaths | 821 | 1,075 | 1,190 | 1,241 | 1,214 | 1,307 | 1,282 | 1,386 | 1,386 |
| Number of deaths per 1000 PWE in the CPRD | 16.9 | 22.1 | 24.8 | 26.4 | 26.4 | 29.4 | 30.1 | 34.5 | 36.6 |

Note: PWE defined as having an epilepsy diagnostic code and at least two prescriptions of AEDs, aged >17. Study period was from 1st April 2004 to 31st March 2014. Only data from full calendar years within that time frame were used for this table.

Cause of death

The main causes of death for PWE aged 18 to 64 years old were neoplasms (26.8%), diseases of the circulatory system (15.4%) and epilepsy (14.2%) (Table 2a). For PWE 65 years and over, the main

causes of death were diseases of the circulatory system (37.3%), neoplasms (17.2%) and diseases of the respiratory system (15.6%) (Table 2b). Deaths due to epilepsy as a primary cause were documented in 2.7% of older PWE.

Table 2a. Documented main cause of death of people with epilepsy under 65 years

| ICD-10 category | Under 65, n (%) |
|---|----------------------|
| Neoplasms (C00-D48) | 571(26.9) |
| Diseases of the circulatory system (I00-I99) | 330 (15.6) |

| Diseases of the respiratory system (J00-J99) | 176 (8.3) |
| Diseases of the nervous system (G00-G37, G43-G99), excluding epilepsy | 164 (7.7) |
| Diseases of the digestive system (K00-KK93) | 161 (7.6) |
| External causes of morbidity and mortality (V01-X59, X85-Y98) | 129 (6.1) |
| Congenital malformations, deformations and chromosomal abnormalities (Q00-Q99) | 70 (3.3) |
| Mental and behavioural disorders (F00-F99) | 61 (2.9) |
| Endocrine, nutritional and metabolic diseases (E00-E90) | 34 (1.6) |
| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99) | 29 (1.4) |
| External causes of morbidity and mortality (intentional) (X60-X84) | 28 (1.3) |
| Diseases of the genitourinary system (N00-N99) | 23 (1.1) |
| Certain infectious and parasitic diseases (A00-B99) | 20 (0.9) |
| Diseases of the blood and blood-forming organs (D50-D89) | 9 (0.4) |
| Diseases of the musculoskeletal system and connective tissue (M00-M99) | 9 (0.4) |
| Diseases of the skin and subcutaneous tissue (L00-L99) | 4 (0.2) |
| Total | 2,120 (100.0) |

Table 2b. Documented main cause of death of people with epilepsy aged 65 and over

| ICD-10 category | 65 and over, n (%) |
|---|----------------------|
| Diseases of the circulatory system (I00-I99) | 1973 (37.3) |
| Neoplasms (C00-D48) | 910 (17.2) |
| Diseases of the respiratory system (J00-J99) | 827 (15.6) |
| Mental and behavioural disorders (F00-F99) | 479 (9.1) |
| Diseases of the nervous system (G00-G37, G43-G99), excluding epilepsy | 295 (5.6) |
| Diseases of the digestive system (K00-KK93) | 173 (3.3) |
| Epilepsy (G40-G41) | 142 (2.7) |
| Diseases of the genitourinary system (N00-N99) | 130 (2.5) |
| External causes of morbidity and mortality (V01-X59, X85-Y98) | 88 (1.7) |
| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99) | 86 (1.6) |
| Endocrine, nutritional and metabolic diseases (E00-E90) | 67 (1.3) |
| Certain infectious and parasitic diseases (A00-B99) | 46 (0.9) |
| Diseases of the musculoskeletal system and connective tissue (M00-M99) | 29 (0.5) |
| Congenital malformations, deformations and chromosomal abnormalities (Q00-Q99) | 15 (0.3) |
| Diseases of the skin and subcutaneous tissue (L00-L99) | 13 (0.2) |
| Diseases of the blood and blood-forming organs (D50-D89) | 8 (0.2) |
| External causes of morbidity and mortality (intentional) (X60-X84) | 4 (0.1) |
| Total | 5,285 (100.0) |

We tabulated the number of deaths with epilepsy listed as a cause of death, either the main or a contributing cause (Table 3). In PWE under 35, almost 45% of deaths had epilepsy as a contributory cause (35.1% to 53.3%, with a mean of 44.2%) (Table 3). The trends are similar between sexes under 35 and over 65. However, they differ in middle-age. At age 40, epilepsy-contributing deaths were 2-fold higher in male compared to female PWE.

Table 3. Epilepsy documented as a contributing cause of death by age group

| Age group | Male | | Female | |
|-----------|---------------------|---|---------------------|---|
| | All cause deaths, n | Deaths with epilepsy as contributing cause, n (%) | All cause deaths, n | Deaths with epilepsy as contributing cause, n (%) |
| 18-19 | 15 | 8 (53.3) | 8 | 3 (37.5) |
| 20-24 | 37 | 17 (45.9) | 29 | 13 (44.8) |
| 25-29 | 45 | 22 (48.9) | 37 | 17 (45.9) |
| 30-34 | 64 | 27 (42.2) | 37 | 13 (35.1) |
| 35-39 | 81 | 19 (23.5) | 62 | 17 (27.4) |
| 40-44 | 135 | 44 (32.6) | 75 | 12 (16.0) |
| 45-49 | 157 | 42 (26.8) | 104 | 18 (17.3) |
| 50-54 | 213 | 58 (27.2) | 114 | 19 (16.7) |
| 55-59 | 238 | 44 (18.5) | 165 | 23 (13.9) |
| 60-64 | 291 | 63 (21.6) | 213 | 36 (16.9) |
| 65-69 | 323 | 42 (13.0) | 266 | 38 (14.3) |
| 70-74 | 442 | 60 (13.6) | 295 | 34 (11.5) |
| 75-79 | 475 | 44 (9.3) | 444 | 57 (12.8) |
| 80-84 | 517 | 53 (10.3) | 578 | 68 (11.8) |
| 85-89 | 485 | 54 (11.1) | 623 | 62 (10.0) |
| 90-105 | 290 | 22 (7.6) | 547 | 65 (11.9) |

To explore whether there were changes in the causes of death over time, we tabulated the main cause of death by year (Supplementary File Table S1). Diseases of the circulatory system were consistently listed as the highest main cause of death for each year. The proportion of deaths due to mental and behavioural disorders doubled from 2011 onwards (mean percentage for 2005 to 2010: 5.05%, mean percentage for 2011 to 2013: 10.7%). The proportion of deaths attributed to epilepsy as the primary cause remained relatively stable throughout (6.3% for 2005 to 5.2% for 2013), although the number of deaths this represented increased (33 in 2005 to 51 to 2013).

Risk factors

Risk factors included in the model, frequencies and associated ORs are presented in Table 4. Attendance at emergency departments in the previous 12 months was associated with the highest risk (OR: 3.06 CI: 2.83 – 3.31). Compared to being prescribed one AED, prescription of two or more AEDs was associated with an elevated risk of death (2 AEDs: OR 1.69 CI: 1.58 – 1.79; 3 AEDs: OR: 2.23 CI: 2.01 – 2.48; 4+ AEDs: OR: 2.94 CI: 2.50 – 3.46), while no AED prescription was associated with a lower risk (OR: 0.36 CI: 0.31 – 0.42) (Table 4). Other factors associated with an increased risk of mortality included experiencing status epilepticus within the past 12 months (OR: 2.62 CI: 1.54 – 4.45),

depression (OR: 1.67 CI: 1.57 – 1.77), smoking (OR: 1.43 CI: 1.32 – 1.54), injury (OR: 1.40 CI: 1.30 – 1.51), and history of dementia (OR: 1.37 CI: 1.25 – 1.51) and stroke (OR: 1.37 CI: 1.25 – 1.49).

A lower risk of death was associated with seizure freedom in the previous 12 months (OR: 0.77 CI: 0.70 – 0.86) and a higher prescription adherence (75 to 100% adherence: OR 0.57 CI: 0.51 – 0.64).

Table 4. Risk factors Increasing mortality in PWE

| Factor | Group | Controls | | Cases | | Odds Ratio | 95% Confidence interval |
|---|--------------|----------|------|-------|------|------------|-------------------------|
| | | n | % | n | % | | |

DISCUSSION

We examined the causes of death among PWE and risk factors associated with mortality in a group of PWE derived from primary care data. The number of PWE with recorded deaths increased throughout our 9-year study period while the deaths attributed to epilepsy remained stable. In our model, we found important factors associated with a higher risk of mortality, some of which could be identified and potentially ameliorated by step-up care.

1
2
3 There were differences in the proportion of deaths attributed to epilepsy between younger and older
4 PWE. Studies have found deaths of younger PWE are more often attributed to epilepsy.^{20 21} Indeed,
5 epilepsy was the third highest main cause of death in younger PWE in our study, accounting for almost
6 15% of deaths. This increased to 35-50% when evaluating all contributing causes in age groups under
7 35. As younger PWE tend to have less co-morbidity than older adults, it may be simpler to attribute
8 epilepsy as the main cause of death. New diagnoses of epilepsy in people over 65 are often secondary
9 to cerebrovascular disease such as stroke or neoplasms in the brain.²² In our study, dementia was
10 found to increase the risk of death, which has been found to share biological links with epilepsy.²³ New
11 onset epilepsy in older people tends to be better controlled with AEDs.²⁴ Thus, other co-morbidity
12 may take precedence in older PWE when documenting the cause of death, as epilepsy contributed to
13 only about 10% of deaths and was listed as a main cause in 3%.

17 **Factors associated with increased risk of death**

19 Our findings support evidence from previous studies. Factors associated with risk of mortality in
20 epilepsy included: depression,^{5 16 25} injuries,^{3 5 9 16 26} dementia and stroke,^{13 27} age,¹³ prescription
21 adherence,^{16 28 29} and seizure freedom.^{3 13 15 16} Novel findings include increased risk associated with
22 emergency department visits and/or emergency admissions, prescription of more than one AED, and
23 status epilepticus. Status epilepticus is a known cause of death,^{13 21 30} however, to our knowledge, it
24 has not been included within a risk model before.

27 **Clinical Implications**

29 **Epilepsy management**

31 The need for better epilepsy management is at the core of our findings. Several risk factors are linked
32 within this theme such as emergency department attendance, polypharmacy, injury, adherence, and
33 seizure freedom.

35 Visits to emergency departments or emergency admissions were associated with a 3-fold increased
36 risk of death, the highest risk in our model. Visits to emergency services are associated with having
37 injuries,²⁹ experiencing a seizure or a change in normal seizure presentation,³¹ and having less
38 confidence in self-management.³² Attendance to emergency departments for epilepsy could thus be
39 considered a surrogate marker for poor epilepsy management.³³ The National Audit of Seizure
40 management in Hospitals (NASH), conducted during our study period in 2011 and 2013, found 63% of
41 PWE presenting to emergency departments for seizures had not been seen by a specialist in the
42 previous year.³⁴ Moreover only half of attendees were either seen by a neurologist on site or referred
43 to one upon discharge.³⁴ These are missed opportunities to follow-up with patients who may be in
44 need of clinical review or help with self-management, putting them at greater risk of death.

47 **Areas for possible intervention**

49 Regular medication review for multiple AEDs may be important as increased mortality risk was
50 associated with two or more AEDs. Prescriptions of multiple AEDs may be an effect of having more
51 refractory and harder to control epilepsy. However, polypharmacy may also result in more side-effects
52 and different treatment schedules which could lead to more problems with medication adherence.³⁵

55 Adherence to medication treatment was found to be associated with fewer emergency department
56 admissions, injuries, and lower costs.^{28 29} In our study, higher rates of AED prescription collection was
57 associated with a lower risk of death. However, the data we used had no granular information on
58 medication adherence, or how medication was taken, only regular prescription collection. Collecting
59 prescribed medicines requires a certain level of engagement and may be higher in those with better
60

1
2
3 self-management. Up to 50% of PWE can be non-adherent to treatment for various reasons,²⁹
4 intentional or unintentional, with memory issues, side-effects and poor communication between
5 patients and clinicians being factors.^{36 37} In the UK, medication for epilepsy is free and thus financial
6 reasons would not be a factor for our study. However, availability of free medication can depend on
7 adequate drug supply from manufacturers and having access to pharmacies. Annual medication
8 reviews were part of the QOF programme for epilepsy within our study time frame. This may have
9 improved prescription adherence, in other words collection of prescribed AEDs, which was high in our
10 study. Discussing issues around adherence help elucidate barriers to better self-management.

11
12
13 Depression has been reported in about 25% of PWE.^{38 39} In our study, we found 30% of cases and 20%
14 of controls had either a diagnosis of depression or a prescription of anti-depressants. Depression and
15 other psychiatric disorders have been found to be associated with worse quality of life⁴⁰ and affect
16 self-management.⁴¹ Many PWE have said they do not feel their mental health needs are being
17 addressed and thus depression may be underassessed in this patient group.⁴² As the proportion of
18 deaths with psychiatric illness as a main cause increased 2-fold in our study period, psychiatric
19 assessment and management should be provided for people with epilepsy.

20
21
22 Ultimately, the goal of better epilepsy management is seizure reduction or seizure freedom. Seizure
23 freedom was associated with a 20% reduced risk of mortality in our model. Previous findings showed
24 seizure freedom conveyed similar mortality rates as observed in the general population.¹⁵

25 26 27 Other factors

28
29 We explored lifestyle factors which may be associated with increased mortality and found smoking to
30 be associated with a higher risk. Other findings may be less amenable to change, although some
31 intervention may be helpful. For example, experiencing status epilepticus in the previous 12 months
32 was associated with a higher risk of death. In epilepsy, it is most often caused by low blood levels of
33 AEDs or alcohol misuse.⁴³ Injury to the brain (trauma, hypoxia, anoxia), tumours, infections and stroke
34 can also trigger status epilepticus and thus it may not always be preventable.⁴³

35 36 37 **Strengths and limitations**

38
39 The CPRD contains data collected from primary care which is vast and increased the generalisability
40 of results as all participating UK practices were included. The quality of information in the CPRD is
41 dependent on data entered by practice staff during consultations. Items not applicable for a patient
42 may be left off, rather than recorded as such. In the case of diagnosis, there is no option for a GP to
43 enter an absence of diagnosis. For this reason, we interpreted missing data as “no” or “no
44 complication”, however we recognise this may be a limitation for some factors. Other limitations
45 include not knowing the cause of injuries or hospital attendance and thus they may be unrelated to
46 epilepsy.

47
48
49 The time frame of our analysis corresponded to the period where epilepsy was part of the Quality and
50 Outcomes Framework, a programme whereby GPs were contracted to record specific characteristics
51 of their patients with epilepsy.⁴⁴ In particular, data on drug treatment, seizure frequency and seizure
52 freedom were part of this programme.⁴⁴ We hypothesized that this would lead to better quality data
53 for epilepsy and strengthen the study. While the data collected may be more complete than years
54 prior, GP practices were less successful in achieving targets for epilepsy compared to other conditions,
55 some of which are more highly rewarded.^{44 45} Older data may contain outdated diagnoses of epilepsy
56 which may not have been reconfirmed by today’s standards, and if in remission, might not have been
57 designated with an epilepsy resolved code. This could lead to missing epilepsy data. However, the
58
59
60

1
2
3 strength of the CRPD is the vast data collected from the community setting compared to hospital
4 databases.
5

6 Death certificate data for epilepsy has often been found to be problematic. A 2002 audit of UK data
7 found up to 40% of deaths were attributed to the wrong cause for PWE.⁴⁶ Epilepsy tends to be
8 underestimated as a cause of death^{8 25} and dismissed for other cardiovascular or respiratory
9 explanations.^{20 25 47} Indeed, we found other diseases were listed as primary cause of death which may
10 in fact have been epilepsy. The percentage of deaths with epilepsy as a main cause remained stable
11 throughout our study, suggesting that practice may not have changed during this time.
12
13

14 **Research Implications**

15
16 Our risk factor model took into account PWE of all ages. However, as the main causes of death differ
17 between younger and older PWE, risk factors may also be different. Indeed, the highest excess
18 mortality due to epilepsy has been observed in younger people.¹⁵ This would benefit from further
19 research, particularly as epilepsy contributed to close to 50% of deaths in some younger age groups.
20 We also did not evaluate potential causes of epilepsy, such as whether stroke or tumours preceded
21 an epilepsy diagnosis, and whether this would impact mortality. In addition, the analysis may benefit
22 from being repeated with more recent data from the CPRD and ONS.
23
24
25

26 **CONCLUSION**

27
28 Several reports, including ours, have shown deaths in epilepsy continue to rise. Epilepsy is deemed a
29 contributing cause of death particularly in young PWE, but less so in those over 65. While epilepsy in
30 older people may be better controlled with AEDs, co-morbidity may mask the impact of epilepsy. We
31 found certain factors are associated with risk of death such as emergency department attendance for
32 epilepsy and admission, AED polytherapy, depression, injuries, and prescription non-adherence. These
33 could be addressed with clinical intervention and more information for self-management.

Supplemental Material

Coding of variables

Age: For cases: age = year of death – year of birth. For matched controls: age = year of death of the matched case – year of birth.

For epilepsy related factors (ie. Relating to seizures and treatment) and lifestyle factors, data from the CPRD was used from the date of death of the matched case up to 12 months prior. These variables are listed below:

Seizure freedom: recoded seizure freedom for > 12 months (medcode: 11015; readcode: 667F.00) in clinical CPRD data.

Prescription adherence: Calculated as a percentage of the previous 12-months covered by AED prescriptions from therapy CPRD data. The variable was converted to a categorical variable for the model by grouping into: 0-25%, >25-50%, >50-75% and >75%-100%.

Number of antiepileptic drugs (AEDs): Number of different types of AEDs prescribed in 12 months were grouped into categories: 0, 1, 2, 3 and 4 or more. Product codes (“prodcodes”) were used from therapy CPRD data to identify AEDs in the database.

Status epilepticus: recorded status epilepticus code in previous 12 months (medcode: 4093; readcode: F253.11) clinical CPRD data.

Injury: any injury documented in clinical CPRD data. A list of medcode/readcodes from clinical CPRD data included: injuries, fractures, dislocations, burns, bruising, contusions, lacerations, abrasions, concussions and wounds.

Emergency department visit or emergency admission: medcode/readcodes for emergency admissions or visits to emergency centres from clinical CPRD data. This included keywords: seen by emergency clinician, in accident and emergency, emergency admission.

Smoking status: Data was coded from medcodes/readcodes related to smoking or smoking cessation interventions in clinical CPRD data and overall smoking status if available in the CPRD Additional Files. For any patients that did not have a smoking status recording in the 12-month data period, the last known recording from clinical data was used. Used code list from *Validity of smoking prevalence estimates from primary care electronic health records compared with national population survey data for England, 2007 to 2011*. Helen P. Booth, A. Toby Prevost and Martin C. Gulliford. 2013.

Depression: the variable was coded as either a documented diagnostic medcode/readcode related to “depression” in clinical CPRD data or a prescription of antidepressants from therapy CRPD data in previous 12 months. Antidepressants were identified through their product codes (prodcodes) from therapy data.

For co-morbidity, data coded for patient’s lifetime (within start and end dates with acceptable quality data recording):

Dementia: medcode/readcode list including for “dementia” and “Alzheimer’s” in patient history from clinical CPRD data.

1
2
3 **Stroke:** medcode/readcode list including stroke, cerebral ischemia/arterial
4 occlusion/haemorrhage/infarction. embolism in patient history from clinical CPRD data.

STROBE Statement—checklist of items that should be included in reports of observational studies

| | Item No | Recommendation | Page No |
|------------------------------|---------|--|---------|
| Title and abstract | 1 | (a) Indicate the study's design with a commonly used term in the title or the abstract | 1 |
| | | (b) Provide in the abstract an informative and balanced summary of what was done and what was found | 2 |
| Introduction | | | |
| Background/rationale | 2 | Explain the scientific background and rationale for the investigation being reported | 4 |
| Objectives | 3 | State specific objectives, including any prespecified hypotheses | 4 |
| Methods | | | |
| Study design | 4 | Present key elements of study design early in the paper | 4,5 |
| Setting | 5 | Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection | 4,5 |
| Participants | 6 | (a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants | 5 |
| | | (b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case | 5 |
| Variables | 7 | Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable | 5 |
| Data sources/ measurement | 8* | For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group | 5 |
| Bias | 9 | Describe any efforts to address potential sources of bias | N/A |
| Study size | 10 | Explain how the study size was arrived at | 5,6 |
| Quantitative variables | 11 | Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why | 5,6 |
| Statistical methods | 12 | (a) Describe all statistical methods, including those used to control for confounding | 5,6 |
| | | (b) Describe any methods used to examine subgroups and interactions | N/A |
| | | (c) Explain how missing data were addressed | 5 |
| | | (d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy | 5 |
| | | (e) Describe any sensitivity analyses | |

Continued on next page

| Results | | | |
|--------------------------|-----|--|---------|
| Participants | 13* | (a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed | Fig 1 |
| | | (b) Give reasons for non-participation at each stage | Fig 1 |
| | | (c) Consider use of a flow diagram | Fig 1 |
| Descriptive data | 14* | (a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders | 6 |
| | | (b) Indicate number of participants with missing data for each variable of interest | N/A |
| | | (c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount) | |
| Outcome data | 15* | <i>Cohort study</i> —Report numbers of outcome events or summary measures over time | |
| | | <i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure | table 3 |
| | | <i>Cross-sectional study</i> —Report numbers of outcome events or summary measures | |
| Main results | 16 | (a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included | 8,9 |
| | | (b) Report category boundaries when continuous variables were categorized | table 3 |
| | | (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period | N/A |
| Other analyses | 17 | Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses | N/A |
| Discussion | | | |
| Key results | 18 | Summarise key results with reference to study objectives | 9,10 |
| Limitations | 19 | Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias | 11,12 |
| Interpretation | 20 | Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence | 10,11 |
| Generalisability | 21 | Discuss the generalisability (external validity) of the study results | 11,12 |
| Other information | | | |
| Funding | 22 | Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based | 12 |

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). ABSTRACT

Objectives

People with epilepsy (PWE) have a higher mortality rate than the general population. Epilepsy related deaths have increased despite all-cause mortality decreasing in the general population pre-Covid-19. We hypothesized that clinical and lifestyle factors may identify people more at risk.

Design

We used a retrospective cohort study to explore cause of death and a nested case-control study to identify risk factors.

Setting

We explored factors associated with mortality using primary care population data from 01/04/2004 to 31/03/2014. Data was obtained from the Clinical Practice Research Datalink (CPRD) which compiles anonymised patient data from primary care in the UK. Cause of death data was supplemented from the Office of National Statistics when available.

Participants

The analysis included 70,431 people with epilepsy, with 11,241 registered deaths.

Results

The number of deaths within the database increased by 69% between the first and last year of the study. Epilepsy was considered as a contributing cause in approximately 45% of deaths of PWE under 35. Factors associated with increased risk of death included attendance at emergency departments and/or emergency admissions (OR: 3.48 CI: 3.19–3.80), anti-epileptic drug (AED) polytherapy (2 AEDs: OR 1.60 CI:1.51–1.71; 3 AEDs: OR: 2.06 CI: 1.86–2.29; 4+ AEDs: OR: 2.62 CI: 2.23–3.08), status epilepticus (OR: 2.78 CI: 1.64–4.71), depression (OR: 1.67 CI: 1.57–1.76) and injuries (OR: 1.54 CI: 1.35–1.56). No seizures in the prior year (OR: 0.52 CI: 0.41–0.65).

Conclusion

Our results add to existing evidence that deaths in epilepsy are increasing. Future studies could focus on identifying PWE at high risk and addressing them with clinical interventions or better self-management. Identifying specific risk factors for younger people should be a priority as epilepsy may be a factor in close to half of deaths of PWE under 35 years of age.

STRENGTHS AND LIMITATIONS OF THE STUDY

- The study examines the higher mortality rate in epilepsy by exploring risk factors that could be mitigated by interventions in clinical practice
- The study included data collected in primary care which is large and representative compared to hospital data
- The large sample size collected from participating UK practices contributes to the generalisability of the results
- The data set used was from 2004 to 2014, as this covered a period where epilepsy was part of a national programme for outcome reporting.

For peer review only

INTRODUCTION

Epilepsy is one of the most common neurological conditions with about 50 million people affected worldwide.¹ With access to good treatment, it is estimated that 60-70% of people with epilepsy (PWE) can become free of seizure.² However, epilepsy is also an important cause of premature death.³ Mortality rates of people with epilepsy are higher than for the general population.⁴⁻⁹ A longitudinal cohort study from Sweden found that an epilepsy diagnosis was associated with a 14-fold increased risk of all-cause death.⁵ Some studies suggest that this has not changed over time.^{4 10} Other data suggest the number of deaths in PWE is increasing despite a decrease in all-cause mortality in the general population.^{8 11 12} Public Health England reported that deaths with epilepsy as a contributing factor increased by 70% between 2001 and 2014, while all-cause deaths in the population decreased by 6%.¹¹

Some causes of death in PWE are similar to the general population, such as circulatory and respiratory diseases, dementia, Alzheimer's and cancers.^{11 13 14} Others are related to consequences of the condition itself such as injuries, burns and drowning during seizures.^{5 9 15} Lifestyle and psychosocial factors contribute to increased risk of mortality and include alcohol or substance misuse,^{13 16} low adherence to medication,¹⁰ depression,^{5 16} and socioeconomic status.^{11 16} Sudden unexpected death in epilepsy (SUDEP) is sometimes posited as a common cause of death for PWE. A recent review suggests SUDEP accounts for 12% of all-cause deaths in epilepsy.¹⁰ However, factors that can be prevented or treated are under-researched and could lead to more impact on reducing mortality.

In 2011, our group published risk factors increasing mortality in PWE based on population data collected in primary care in the United Kingdom (UK) between 1993 and 2007.¹⁶ Here, we follow-up on the analysis using data collected during an incentivised programme which rewarded enhanced monitoring and care for people with epilepsy in primary care over ten years. We hypothesised that the epilepsy data collected under this programme would be of high quality allowing for a comprehensive analysis of causes and risk factors associated with mortality. We report the number of deaths recorded during this time, the causes of death for younger and older PWE, and risk factors associated with mortality among PWE.

METHODS

Study Design

A retrospective cohort design was used to analyse mortality and causes of death in PWE. Risk factors affecting mortality were analysed using a nested case-control study. This study was approved by the Independent Scientific Advisory Committee of the CPRD (protocol 17_208R2).

Setting

Data was obtained from the Clinical Practice Research Datalink (CPRD). This database contains anonymised patient data obtained from electronic records from primary care clinics in the UK. The data is sent from participating clinics to a central server where data is cleaned, checked for quality and curated. A study from 2015 counted 11,299,221 patients registered in the CPRD from 674 GP practices.¹⁷ Patients in the database were representative of the UK population when compared to the 2011 census.¹⁷ For our study period, mid-year counts for 2004 show 4,584,065 patients were active in the database (alive and currently registered in a GP practice) with 50.1% being female. In 2013, 4,493,034 patients were active at mid-year and 50.4% were female.

Our study period was from 01/04/2004 to 31/03/2014 during which epilepsy management came under the Quality and Outcomes Framework (QOF), a programme implemented within the primary care setting. Revised QOF clinical indicators were implemented in April 2014 when most epilepsy indicators were discontinued. The aim of the programme was to incentivize improvement in the recording of clinical information on specific lifestyle items or long term health conditions with the view that structured monitoring and reporting improved the quality of care.¹⁸

Types of data

The CPRD includes “patient data” which include demographic information, “clinical data” include information on clinical events such as diagnosis or symptoms, and “additional clinical details” that include lifestyle factors. It also includes “therapy data” which contains information on prescriptions, product codes, doses and treatment schedules. Clinical data are entered initially as alpha numeric Read codes by the GP into electronic medical records. These are converted into numeric Medcodes within the CPRD for easier analysis by researchers. Medication types are recorded in “therapy data” as numeric Procodes.

Cause of death information was obtained when available through linked data for a subset of patients from England and Wales from the Office of National Statistics (ONS). The cause of death is presented using ICD-10 diagnostic codes and offers the main cause and up to 15 contributing causes, if applicable. Date of death was available both from the CPRD and ONS data and the earliest date of the two was used if there were discrepancies. The Index of Multiple Deprivation (IMD) was also obtained for each patient’s GP practice, which was used for control matching in the case-control study. Practice IMD data was “most up to date” version when requested in 2018.

Cohort study participants

For the mortality and cause of death cohort study, adults with epilepsy were included who were least 18 years old at time of death. Epilepsy was defined as having a documented epilepsy diagnostic code or seizure code and at least two prescriptions of antiepileptic drugs (AEDs). Using a diagnostic or seizure code with prescription data has been validated to identify cases of epilepsy in routinely collected data.¹⁹ Any patient with a diagnostic code of “epilepsy resolved” was removed from the study (Medcodes 8385 and 12848, Read codes 2126000 and 212J.00). Codes used to identify epilepsy and seizures are presented in Table S1 (Supplemental File 1).

Case-control study participants

Since we were focusing on the specific 12-month period prior to date of death to establish preventable risk factors, we opted to use a nested case-control study design. Cases were defined as PWE within the cohort with a documented date of death between 01/04/2004 to 31/03/2014 with at least 12 months of data recorded in our study period (thus earliest data of death included was 01/04/2005). Controls were randomly matched at a ratio of 3:1 by sex, practice IMD, year of birth (+/- 1 year). For cases aged 18, controls were matched for year of birth + 1 year. Controls were alive for at least 12 months after the date of death of their matched case. The first analysis was conducted for the whole dataset and a second one used data from PWE under the age of 35.

Exposure variables

Potential variables were selected based on existing literature, items part of the QOF and others associated with lifestyle. Exposure data were refined based on the availability and reliability of data in the CPRD. Full description of variables and sources of data are included in the Supplemental File 1. List of codes used for each variable can be found in Supplemental File 2. We assessed variables occurring

1
2
3 in the 12 months prior to the case's date of death for emergency department visits or emergency
4 admissions, number of AEDs, status epilepticus, depression, injury, smoking status, and seizure
5 freedom. History of co-morbidity was taken from all available patient data for dementia and stroke.
6 Missing data was considered as "no" for binary outcomes except for smoking status where the last
7 known status was used, as previously reported.²⁰ Variables that were considered but not included due
8 to poor quality of data included alcohol and substance use.
9

10 11 **Statistics**

12
13 The number all-cause deaths recorded in the CPRD was calculated for complete calendar years (from
14 2005 to 2013) to allow for comparisons with previous publications. All other analyses used data from
15 the full study period (01/04/2004 to 31/03/2014). The cause of death data was analysed two ways: 1)
16 tabulating the main cause of death in PWE and 2) evaluating the proportion of deaths with epilepsy
17 listed as a contributing cause. A contributing cause was defined as either the main cause or listed as a
18 cause in any of the other 15 positions on the death certificate. The main causes of death are presented
19 for younger and older PWE with 65 years as the cut-off. Deaths with epilepsy as a contributing cause
20 were divided by age group. To track trends, an additional analysis of main cause of death by full
21 calendar year is presented in supplemental material (Table S2, Supplemental File 1).
22

23
24 Conditional logistic regression was used for the nested case-control study. Variables were included in
25 the model following maximum likelihood and Akaike information criterion (AIC) testing. Potential
26 confounders such as age, sex, and deprivation were addressed by control matching. Data are
27 presented as odds ratios (ORs) and 95% confidence intervals. The analysis was conducted for the
28 whole dataset and subsequently for the subset of PWE aged under 35.
29

30
31 The following interactions were tested: age and emergency visit/admission, age and injury, age and
32 dementia, age and stroke, status epilepticus and emergency visit/admissions, number of AEDs and
33 seizure freedom, prescription issue and number of AEDs, injury and emergency visit/admission.
34

35 **Patient and Public Involvement**

36
37 Patients or the public were not involved in the design, or conduct, or reporting, or dissemination plans
38 of our research.
39

40 41 42 **RESULTS**

43
44 We obtained a sample size of 70,431 PWE with 11,241 who had a documented date of death within
45 our time frame (Figure 1). We obtained cause of death for 7,405 people from ONS linked data. Age of
46 patients ranged 18 to 105 with 50.8% male.
47

48 **Number of deaths**

49
50 The number of deaths recorded in the database increased between 2005 to 2013, from 821 to 1,386
51 which represents a 68.8% increase (Table 1). This increase was not attributed to more PWE being
52 registered in the database as this decreased by 21.8% over the same period. The mean age of the
53 participants within the database increased over time.

Table 1. Number of recorded deaths of PWE in the CPRD per full year within the study period.

| | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 |
|--|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| Average age of adult PWE in the database, mean (SD) | 48.7 (18.5) | 49.0 (18.6) | 49.3 (18.6) | 49.6 (18.6) | 49.9 (18.6) | 50.2 (18.6) | 50.5 (18.6) | 50.8 (18.6) | 51.2 (18.6) |
| Number of PWE registered in the database | 48,447 | 48,585 | 48,031 | 46,948 | 45,941 | 44,485 | 42,521 | 40,120 | 37,865 |
| Number of recorded deaths | 821 | 1,075 | 1,190 | 1,241 | 1,214 | 1,307 | 1,282 | 1,386 | 1,386 |
| Number of deaths per 1000 PWE in the CPRD | 16.9 | 22.1 | 24.8 | 26.4 | 26.4 | 29.4 | 30.1 | 34.5 | 36.6 |

Note: PWE defined as having an epilepsy diagnostic code and at least two prescriptions of AEDs, aged >17. Study period was from 1st April 2004 to 31st March 2014. Only data from full calendar years within this time frame were used for this table.

Cause of death

The main causes of death for PWE aged 18 to 64 years old were neoplasms (26.8%), diseases of the circulatory system (15.4%) and epilepsy (14.2%) (Table 2a). For PWE 65 years and over, the main causes of death were diseases of the circulatory system (37.3%), neoplasms (17.2%) and diseases of the respiratory system (15.6%) (Table 2b). Deaths due to epilepsy as a primary cause were documented in 2.7% of older PWE.

Table 2a. Documented main cause of death of people with epilepsy under 65 years

| ICD-10 category | Under 65, n (%) |
|---|-----------------|
| Neoplasms (C00-D48) | 571 (26.9) |
| Diseases of the circulatory system (I00-I99) | 330 (15.6) |
| Epilepsy (G40-G41) | 302 (14.2) |
| Diseases of the respiratory system (J00-J99) | 176 (8.3) |
| Diseases of the nervous system (G00-G37, G43-G99), excluding epilepsy | 164 (7.7) |
| Diseases of the digestive system (K00-KK93) | 161 (7.6) |
| External causes of morbidity and mortality (V01-X59, X85-Y98) | 129 (6.1) |
| Congenital malformations, deformations and chromosomal abnormalities (Q00-Q99) | 70 (3.3) |
| Mental and behavioural disorders (F00-F99) | 61 (2.9) |
| Endocrine, nutritional and metabolic diseases (E00-E90) | 34 (1.6) |
| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99) | 29 (1.4) |
| External causes of morbidity and mortality (intentional) (X60-X84) | 28 (1.3) |
| Diseases of the genitourinary system (N00-N99) | 23 (1.1) |
| Certain infectious and parasitic diseases (A00-B99) | 20 (0.9) |

| | |
|--|----------------------|
| Diseases of the blood and blood-forming organs (D50-D89) | 9 (0.4) |
| Diseases of the musculoskeletal system and connective tissue (M00-M99) | 9 (0.4) |
| Diseases of the skin and subcutaneous tissue (L00-L99) | 4 (0.2) |
| Total | 2,120 (100.0) |

Table 2b. Documented main cause of death of people with epilepsy aged 65 and over

| ICD-10 category | 65 and over, n (%) |
|---|----------------------|
| Diseases of the circulatory system (I00-I99) | 1973 (37.3) |
| Neoplasms (C00-D48) | 910 (17.2) |
| Diseases of the respiratory system (J00-J99) | 827 (15.6) |
| Mental and behavioural disorders (F00-F99) | 479 (9.1) |
| Diseases of the nervous system (G00-G37, G43-G99), excluding epilepsy | 295 (5.6) |
| Diseases of the digestive system (K00-KK93) | 173 (3.3) |
| Epilepsy (G40-G41) | 142 (2.7) |
| Diseases of the genitourinary system (N00-N99) | 130 (2.5) |
| External causes of morbidity and mortality (V01-X59, X85-Y98) | 88 (1.7) |
| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99) | 86 (1.6) |
| Endocrine, nutritional and metabolic diseases (E00-E90) | 67 (1.3) |
| Certain infectious and parasitic diseases (A00-B99) | 46 (0.9) |
| Diseases of the musculoskeletal system and connective tissue (M00-M99) | 29 (0.5) |
| Congenital malformations, deformations and chromosomal abnormalities (Q00-Q99) | 15 (0.3) |
| Diseases of the skin and subcutaneous tissue (L00-L99) | 13 (0.2) |
| Diseases of the blood and blood-forming organs (D50-D89) | 8 (0.2) |
| External causes of morbidity and mortality (intentional) (X60-X84) | 4 (0.1) |
| Total | 5,285 (100.0) |

We tabulated the number of deaths with epilepsy listed as a cause of death, either the main or a contributing cause (Table 3). In PWE under 35, almost 45% of deaths had epilepsy as a contributory cause (35.1% to 53.3%, with a mean of 44.2%) (Table 3). The trends are similar between sexes under 35 and over 65. However, they differ in middle-age. At the 40-44 age group, epilepsy-contributing deaths were 2-fold higher in male compared to female PWE.

Table 3. Epilepsy documented as a contributing cause of death by age group

| Age group | Male | | Female | |
|-----------|---------------------|---|---------------------|---|
| | All cause deaths, n | Deaths with epilepsy as contributing cause, n (%) [95% Confidence Interval] | All cause deaths, n | Deaths with epilepsy as contributing cause, n (%) [95% Confidence Interval] |
| 18-19 | 15 | 8 (53.3) [28.1 – 78.6] | 8 | 3 (37.5) [4.0 – 71.0] |
| 20-24 | 37 | 17 (45.9) [29.9 – 62.0] | 29 | 13 (44.8) [26.7 – 62.9] |
| 25-29 | 45 | 22 (48.9) [34.3 – 63.5] | 37 | 17 (45.9) [29.9 – 62.0] |
| 30-34 | 64 | 27 (42.2) [30.1 – 54.3] | 37 | 13 (35.1) [19.8 – 50.5] |
| 35-39 | 81 | 19 (23.5) [14.2 – 32.7] | 62 | 17 (27.4) [16.3 – 38.5] |
| 40-44 | 135 | 44 (32.6) [24.7 – 40.5] | 75 | 12 (16.0) [7.7 – 24.3] |

| | | | | |
|--------|-----|-------------------------|-----|-------------------------|
| 45-49 | 157 | 42 (26.8) [19.8 – 33.7] | 104 | 18 (17.3) [10.0 – 24.6] |
| 50-54 | 213 | 58 (27.2) [21.3 – 33.2] | 114 | 19 (16.7) [9.8 – 23.5] |
| 55-59 | 238 | 44 (18.5) [13.6 – 23.4] | 165 | 23 (13.9) [8.7 – 19.2] |
| 60-64 | 291 | 63 (21.6) [16.9 – 26.4] | 213 | 36 (16.9) [11.9 – 21.9] |
| 65-69 | 323 | 42 (13.0) [9.3 – 16.7] | 266 | 38 (14.3) [10.1 – 18.5] |
| 70-74 | 442 | 60 (13.6) [10.4 – 16.8] | 295 | 34 (11.5) [7.9 – 15.2] |
| 75-79 | 475 | 44 (9.3) [6.7 – 11.9] | 444 | 57 (12.8) [9.7 – 15.9] |
| 80-84 | 517 | 53 (10.3) [7.6 – 12.9] | 578 | 68 (11.8) [9.1 – 14.4] |
| 85-89 | 485 | 54 (11.1) [8.3 – 13.9] | 623 | 62 (10.0) [7.6 – 12.3] |
| 90-105 | 290 | 22 (7.6) [4.5 – 10.6] | 547 | 65 (11.9) [9.2 – 14.6] |

To explore whether there were changes in the causes of death over time, we tabulated the main cause of death by year (Supplementary File 1, Table S2). Diseases of the circulatory system were consistently listed as the highest main cause of death for each year. The proportion of deaths due to mental and behavioural disorders doubled from 2011 onwards (mean percentage for 2005 to 2010: 5.05%, mean percentage for 2011 to 2013: 10.7%). The proportion of deaths attributed to epilepsy as the primary cause remained relatively stable throughout (6.3% for 2005 to 5.2% for 2013), although the number of deaths this represented increased (33 in 2005 to 51 to 2013).

Risk factors

Risk factors included in the model, frequencies and associated ORs are presented in Table 4. Attendance at emergency departments in the previous 12 months was associated with the highest risk (OR: 3.48 CI: 3.19 – 3.80). Compared to being prescribed one AED, prescription of two or more AEDs was associated with an elevated risk of death (2 AEDs: OR: 1.60 CI: 1.51 – 1.71; 3 AEDs: OR: 2.06 CI: 1.86 – 2.29; 4+ AEDs: OR: 2.62 CI: 2.23 – 3.08), while no AED prescription was associated with a lower risk (OR: 0.77 CI: 0.68 – 0.87) (Table 4). Other factors associated with an increased risk of mortality included experiencing status epilepticus within the past 12 months (OR: 2.78 CI: 1.64 – 4.71), depression (OR: 1.67 CI: 1.57 – 1.76), smoking (OR: 1.45 CI: 1.35 – 1.56), injury (OR: 1.54 CI: 1.43 – 1.67), and history of dementia (OR: 1.39 CI: 1.26 – 1.53) and stroke (OR: 1.07 CI: 1.01 – 1.14).

A lower risk of death was associated with seizure freedom in the previous 12 months (OR: 0.52 CI: 0.41 – 0.65).

We found an interaction between having an emergency department visit or emergency admission and injury (OR: 0.59 CI: 0.48 – 0.70).

As the cohort analysis of cause of death revealed epilepsy was a significant contributing factor of the cause of death in young PWE, we repeated the risk factor analysis for PWE aged under 35. Significant risk factors associated with risk of death included emergency department visit (OR: 3.90 CI: 2.44 – 6.23), number of AEDs (No AEDs: 0.42 CI 0.21 – 0.84, 2 AEDs: OR: 1.72 CI: 1.23 – 2.40; 3 AEDs OR: 2.37 CI 1.52 – 3.67, 4+ AEDs: OR: 3.76 CI: 2.26 – 6.26), injury (OR: 1.99 CI: 1.19 – 3.31) and seizure freedom (OR: 0.17 CI 0.02 – 1.44).

Table 4. Risk factors Increasing mortality in PWE

| Factor | Group | All | | | | Age < 35 | | | |
|---|------------|----------------|--------------|------------|-------------------------|----------------|-------------|------------|-------------------------|
| | | Controls n (%) | Cases n (%) | Odds Ratio | 95% Confidence interval | Controls n (%) | Cases n (%) | Odds Ratio | 95% Confidence interval |
| Emergency department visit or emergency admission | no | 25,712 (94.2) | 7,469 (82.1) | reference | | 875 (95.9) | 252 (82.9) | reference | |

DISCUSSION

We examined the causes of death among PWE and risk factors associated with mortality in a group of PWE derived from primary care data. The number of PWE with recorded deaths increased throughout our 9-year study period while the deaths attributed to epilepsy remained stable. In our model, we found important factors associated with a higher risk of mortality, some of which could be identified and potentially ameliorated by step-up care.

There were differences in the proportion of deaths attributed to epilepsy between younger and older PWE. Studies have found deaths of younger PWE are more often attributed to epilepsy.^{21 22} Indeed, epilepsy was the third highest main cause of death in younger PWE in our study, accounting for almost 15% of deaths. This increased to 35-50% when evaluating all contributing causes in age groups under 35. As younger PWE tend to have less co-morbidity than older adults, it may be simpler to attribute epilepsy as the main cause of death. New diagnoses of epilepsy in people over 65 are often secondary to cerebrovascular disease such as stroke or neoplasms in the brain.²³ In our study, dementia was found to increase the risk of death, which has been found to share biological links with epilepsy.²⁴ New onset epilepsy in older people tends to be better controlled with AEDs.²⁵ Thus, other co-morbidity may take precedence in older PWE when documenting the cause of death, as epilepsy contributed to only about 10% of deaths and was listed as a main cause in 3%.

Factors associated with increased risk of death

Our findings support evidence from previous studies. Factors associated with risk of mortality in epilepsy included: depression,^{5 16 26} injuries,^{3 5 9 16 27} dementia and stroke,^{13 28} age,¹³ and seizure freedom.^{3 13 15 16} Novel findings include increased risk associated with emergency department visits and/or emergency admissions, prescription of more than one AED, and status epilepticus. Status epilepticus is a known cause of death,^{13 22 29} however, to our knowledge, it has not been included within a risk model before.

For the younger PWE group, emergency visit or emergency admissions, number of AEDs and injury were associated with higher risk of death. While, like the wider-sample, seizure freedom was associated with a lower risk of death.

Clinical Implications

Epilepsy management

The need for better epilepsy management is at the core of our findings. Several risk factors are linked within this theme such as emergency department attendance, polypharmacy, injury, and seizure freedom.

Visits to emergency departments or emergency admissions were associated with a 3-fold increased risk of death, the highest risk in our model. Visits to emergency services are associated with having injuries,³⁰ experiencing a seizure or a change in normal seizure presentation,³¹ and having less confidence in self-management.³² Attendance at emergency departments for epilepsy could thus be considered a surrogate marker for poorer epilepsy control.³³ The National Audit of Seizure management in Hospitals (NASH), conducted during our study period in 2011 and 2013, found 63% of PWE presenting to emergency departments for seizures had not been seen by a specialist in the previous year.³⁴ Moreover only half of attendees were either seen by a neurologist on site or referred to one upon discharge.³⁴ These are missed opportunities to follow-up with patients who may be in need of clinical review and help with self-management, to mitigate their greater risk of death.

Areas for possible intervention

Regular medication review for people on multiple AEDs may be important as increased mortality risk was associated with two or more AEDs. Prescriptions of multiple AEDs may be an effect of having more refractory and harder to control epilepsy. However, polypharmacy may also result in more side-effects and different treatment schedules which could lead to more problems with medication adherence.³⁵

Depression has been reported in about 25% of PWE.^{36 37} In our study, we found 30% of cases and 20% of controls had either a diagnosis of depression or a prescription of anti-depressants. Depression and other psychiatric disorders have been found to be associated with worse quality of life³⁸ and affect self-management.³⁹ Many PWE have said they do not feel their mental health needs are being addressed and thus depression may be underassessed in this patient group.⁴⁰ As the proportion of deaths with psychiatric illness as a main cause increased 2-fold in our study period, psychiatric assessment and management should be provided for people with epilepsy.

Ultimately, the goal of better epilepsy management is seizure reduction or seizure freedom. Seizure freedom was associated with approximately a 50% reduced risk of mortality in our model. Previous findings showed seizure freedom conveyed similar mortality rates for PWE as those observed in the general population.¹⁵

Other factors

We explored lifestyle factors which may be associated with increased mortality and found smoking to be associated with a higher risk. Other findings may be less amenable to change, although some intervention may be helpful. For example, experiencing status epilepticus in the previous 12 months was associated with a higher risk of death. In epilepsy, it is most often associated with low blood levels of AEDs or alcohol misuse.⁴¹ Injury to the brain (trauma, hypoxia, anoxia), tumours, infections and stroke can also trigger status epilepticus and thus it may not be preventable.⁴¹

Strengths and limitations

The CPRD contains data collected from primary care which is vast and increased the generalisability of results as all participating UK practices were included. However, we relied on clinical data which has some limitations as compared to epidemiological studies. It is possible that a small number of cases might have been misclassified as having epilepsy but our case definitions of an epilepsy diagnostic code and AED prescription have been validated and used in previous studies.^{16 19 42} Conversely, patients who presented to emergency departments or were managed only by hospital specialists might not have been included.

The quality of information in the CPRD is dependent on data entered by practice staff during consultations for clinical use, not for research purposes. Items not applicable for a patient may be left off, rather than recorded as such. In the case of diagnosis, there is no option for a GP to enter an absence of diagnosis. Missing data in routine primary care databases are not missing at random and thus statistical methods of dealing with missing data, such as multiple imputation, may not be appropriate.^{43 44} For this reason, we interpreted missing data as “no” or “no complication”, however we recognise this may be a limitation for some factors. Other limitations include not knowing the cause of injuries or hospital attendance and thus they may be unrelated to epilepsy.

We defined the exposure variables based on previous studies, if available.^{16 20 45} The CPRD information has been validated for long term-conditions, such as dementia and Alzheimer’s disease, and for diagnoses made by hospital consultants.⁴⁶ As GPs issue prescriptions via electronic systems, the CPRD “therapy data” has been found to be highly accurate for medication variables.⁴⁷ However, we included

1
2
3 variables which may not have been previously validated such as injury and emergency department
4 visit or emergency admission which is a limitation of this study. We explored other factors such as
5 severe mental illness, self-injury, patient-level index of multiple deprivation, alcohol use, substance
6 use, pregnancy and learning disability. These were found statistically not significant and not included
7 in the final overall model or the under-35 model.
8
9

10 The time frame of our analysis corresponded to the period where epilepsy was part of the Quality and
11 Outcomes Framework, a programme whereby GPs were contracted to record specific characteristics
12 of their patients with epilepsy.⁴⁸ In particular, data on drug treatment, seizure frequency and seizure
13 freedom were part of this programme.⁴⁸ We hypothesized that this would lead to better quality data
14 for epilepsy and strengthen the study. While the data collected may be more complete than years
15 prior, GP practices were less successful in achieving targets for epilepsy compared to other conditions,
16 some of which are more highly rewarded.^{48 49} Older data may contain outdated diagnoses of epilepsy
17 which may not have been reconfirmed by today's standards, and if in remission, might not have been
18 designated with an epilepsy resolved code. This could lead to missing epilepsy data. However, the
19 strength of the CRPD is the vast data collected from the community setting compared to hospital
20 databases or disease specific registers.^{19 42}
21
22
23

24 A limitation of our cohort study is the use of linked ONS data, which is only available for consenting
25 individuals from England and Wales. Thus, data was not available for our whole cohort, and findings
26 are not generalisable to Scotland and Northern Ireland. Death certificate data for epilepsy has often
27 been found to be problematic. A 2002 audit of UK data found up to 40% of deaths were attributed to
28 the wrong cause for PWE.⁵⁰ Epilepsy tends to be underestimated as a cause of death^{8 26} and dismissed
29 for other cardiovascular or respiratory explanations.^{21 26 51} Indeed, we found other diseases were listed
30 as primary cause of death which may in fact have been epilepsy. The percentage of deaths with
31 epilepsy as a main cause remained stable throughout our study, suggesting that practice may not have
32 changed during this time.
33
34

35 **Research Implications**

36
37 Our initial risk factor model took into account PWE of all ages. However, as the main causes of death
38 differ between younger and older PWE, risk factors may also be different. Thus, we repeated the
39 analysis including PWE under the age of 35. Fewer of the variables were included in this model with
40 the main differences being in lower ORs for having no AED prescription and being seizure free. The
41 highest excess mortality due to epilepsy has been observed in younger people.¹⁵ This would benefit
42 from more research aiming to identify specific risks in younger PWE, particularly as we found epilepsy
43 contributed to close to 50% of deaths in some younger age groups. We also did not evaluate potential
44 causes of epilepsy, such as whether stroke or tumours preceded an epilepsy diagnosis, and whether
45 this would impact mortality. In addition, the analysis may benefit from being repeated with more
46 recent data from the CPRD and ONS.
47
48
49
50

51 **CONCLUSION**

52
53 Several reports, including ours, have shown deaths in epilepsy continue to rise. Epilepsy is deemed a
54 contributing cause of death particularly in young PWE, but less so in those over 65. While epilepsy in
55 older people may be better controlled with AEDs, co-morbidity may mask the impact of epilepsy. We
56 found certain factors are associated with risk of death such as emergency department attendance for
57 epilepsy and admission, AED polytherapy, depression, and injuries. These could be addressed with
58 clinical intervention and more information for self-management.

FUNDING

This work was partly funded by SUDEP Action (award number not applicable).

AUTHOR CONTRIBUTIONS

GW conducted the study, statistical analysis, and write-up of manuscript. MG contributed to the study design, supported the statistical analysis, and write-up. MA contributed to the study design and write-up. MPR contributed to study design. LR contributed to the study design, interpretation, and write-up of findings.

COMPETING INTERESTS

The authors declare no competing interests.

DATA SHARING STATEMENT

This study uses data that is obtained from the CPRD. Requests for data must be approved via the CPRD's Research Data Governance process (formerly the Independent Scientific Advisory Committee).

ETHICS STATEMENT

This study was approved by the CPRD Independent Scientific Advisory Committee (protocol reference: 17_208R2).

| 4109 | SC20000 | Traumatic epilepsy |
| 37644 | F132100 | Progressive myoclonic epilepsy |

Definition of variables

Lists of Medcodes and corresponding Read codes used for each variable can be found in Supplemental file 2. An initial list of Read codes was created for each variable, either based on previous research or by searching specific words in a Read code browser. Medcodes were matched to the Read code list using the CPRD Medical Dictionary. An additional search of the Medcodes was conducted to ensure all appropriate codes were used. Medcodes were used during the analysis in STATA as these are numeric codes. For variables using medication data, lists of prodcodes were generated by searching the CPRD product code list, which lists prodcodes against British National Formulary (BNF) information.

- **Age:** For cases: age = year of death – year of birth. For matched controls: age = year of death of the matched case – year of birth.

For epilepsy related factors (ie. Relating to seizures and treatment) and lifestyle factors, data from the CPRD was used from the date of death of the matched case up to 12 months prior. These variables are listed below:

- **Emergency department visit or emergency admission:** Emergency admissions or visits to emergency centres were identified from “Clinical data” from CPRD. These included keywords: seen by emergency clinician, in accident and emergency, emergency admission. A full list is available in Supplemental File 2.
- **Number of antiepileptic drugs (AEDs):** Number of different types of AEDs prescribed in 12 months were grouped into categories: 0, 1, 2, 3 and “4 or more”. Product codes (“Prodcodes”) were used from “Therapy data” to identify AEDs in the CPRD. A full list of Prodcodes and corresponding definitions is available in Supplemental File 2.
- **Status epilepticus:** recorded status epilepticus code in previous 12 months (medcode: 4093; readcode: F253.11) clinical CPRD data.¹
- **Depression:** the variable was coded as either a documented diagnostic medcode related to “depression” from “Clinical data” or a prescription of antidepressants from “Therapy data” in the previous 12 months.¹ Antidepressants were identified through their product codes (prodcode) from therapy data. A list of medcodes for depression and prodcodes for antidepressants can be found in Supplemental File 2.
- **Smoking status:** Data was coded from medcodes related to smoking or smoking cessation interventions from “Clinical data” and overall smoking status if available in the CPRD “Additional Files”. For any patients that did not have a smoking status recording in the 12-month data period, the last known recording from clinical data was used, as previously described by Booth et al.² The list of medcodes and readcodes used to identify smoking status can be found in Supplemental File 2.
- **Injury:** any injury documented in “Clinical data” was used. A list of medcodes from clinical CPRD data included: injuries, fractures, dislocations, burns, bruising, contusions, lacerations, abrasions, concussions and wounds.¹ A full list of medcodes and corresponding Read codes can be found in Supplemental File 2.
- **Seizure freedom:** recoded seizure freedom for > 12 months (medcode: 11015; readcode: 667F.00) in “Clinical data” from CPRD.¹

For co-morbidity, data coded for patient’s lifetime (within start and end dates with acceptable quality data recording):

- **Dementia:** code list included any medcodes for “dementia” and “Alzheimer’s” in patient history from “Clinical data” in the CPRD. The list of medcodes and corresponding Read codes can be found in Supplemental File 2.

STROBE Statement—checklist of items that should be included in reports of observational studies

| | Item No | Recommendation | Page No |
|---------------------------|---------|--|---------------------------------|
| Title and abstract | 1 | (a) Indicate the study's design with a commonly used term in the title or the abstract | 1 |
| | | (b) Provide in the abstract an informative and balanced summary of what was done and what was found | 2 |
| Introduction | | | |
| Background/rationale | 2 | Explain the scientific background and rationale for the investigation being reported | 4 |
| Objectives | 3 | State specific objectives, including any prespecified hypotheses | 4 |
| Methods | | | |
| Study design | 4 | Present key elements of study design early in the paper | 4,5 |
| Setting | 5 | Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection | 4,5 |
| Participants | 6 | (a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants | 5 |
| | | (b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case | 5 |
| Variables | 7 | Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable | 5, 6 supplemental file 1 and 2 |
| Data sources/measurement | 8* | For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group | 5, 6, supplemental file 1 and 2 |
| Bias | 9 | Describe any efforts to address potential sources of bias | N/A |
| Study size | 10 | Explain how the study size was arrived at | 5,6 |
| Quantitative variables | 11 | Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why | 5,6 |
| Statistical methods | 12 | (a) Describe all statistical methods, including those used to control for confounding | 6 |
| | | (b) Describe any methods used to examine subgroups and interactions | 6 |
| | | (c) Explain how missing data were addressed | 5 |

60**Results**

| | | | |
|------------------|-----|--|-------------|
| Participants | 13* | (a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed | Fig 1 |
| | | (b) Give reasons for non-participation at each stage | Fig 1 |
| | | (c) Consider use of a flow diagram | Fig 1 |
| Descriptive data | 14* | (a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders | 6 |
| | | (b) Indicate number of participants with missing data for each variable of interest | N/A |
| | | (c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount) | N/A |
| Outcome data | 15* | <i>Cohort study</i> —Report numbers of outcome events or summary measures over time | table 1 - 3 |
| | | <i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure | table 4 |
| | | <i>Cross-sectional study</i> —Report numbers of outcome events or summary measures | |
| Main results | 16 | (a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included | 9,10 |
| | | (b) Report category boundaries when continuous variables were categorized | table 4 |
| | | (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period | N/A |
| Other analyses | 17 | Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses | 9 |

Discussion

| | | | |
|------------------|----|--|-------|
| Key results | 18 | Summarise key results with reference to study objectives | 8,9 |
| Limitations | 19 | Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias | 12,13 |
| Interpretation | 20 | Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence | 10,11 |
| Generalisability | 21 | Discuss the generalisability (external validity) of the study results | 13 |

Other information

| | | | |
|---------|----|---|----|
| Funding | 22 | Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based | 14 |
|---------|----|---|----|

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.

ABSTRACT

Objectives

People with epilepsy (PWE) have a higher mortality rate than the general population. Epilepsy related deaths have increased despite all-cause mortality decreasing in the general population pre-Covid-19. We hypothesized that clinical and lifestyle factors may identify people more at risk.

Design

We used a retrospective cohort study to explore cause of death and a nested case-control study to identify risk factors.

Setting

We explored factors associated with mortality using primary care population data from 01/04/2004 to 31/03/2014. Data was obtained from the Clinical Practice Research Datalink (CPRD) which compiles anonymised patient data from primary care in the UK. Cause of death data was supplemented from the Office of National Statistics when available.

Participants

The analysis included 70,431 people with epilepsy, with 11,241 registered deaths.

Results

The number of deaths within the database increased by 69% between the first and last year of the study. Epilepsy was considered as a contributing cause in approximately 45% of deaths of PWE under 35. Factors associated with increased risk of death included attendance at emergency departments and/or emergency admissions (OR: 3.48 CI: 3.19–3.80), anti-epileptic drug (AED) polytherapy (2 AEDs: OR 1.60 CI:1.51–1.71; 3 AEDs: OR: 2.06 CI: 1.86–2.29; 4+ AEDs: OR: 2.62 CI: 2.23–3.08), status epilepticus (OR: 2.78 CI: 1.64–4.71), depression (OR: 1.67 CI: 1.57–1.76) and injuries (OR: 1.54 CI: 1.35–1.56). No seizures in the prior year (OR: 0.52 CI: 0.41–0.65).

Conclusion

Our results add to existing evidence that deaths in epilepsy are increasing. Future studies could focus on identifying PWE at high risk and addressing them with clinical interventions or better self-management. Identifying specific risk factors for younger people should be a priority as epilepsy may be a factor in close to half of deaths of PWE under 35 years of age.

STRENGTHS AND LIMITATIONS OF THE STUDY

- The study examines the higher mortality rate in epilepsy by exploring risk factors that could be mitigated by interventions in clinical practice
- The study included data collected in primary care which is large and representative compared to hospital data
- The large sample size collected from participating UK practices contributes to the generalisability of the results
- The data set used was from 2004 to 2014, as this covered a period where epilepsy was part of a national programme for outcome reporting.

For peer review only

INTRODUCTION

Epilepsy is one of the most common neurological conditions with about 50 million people affected worldwide.¹ With access to good treatment, it is estimated that 60-70% of people with epilepsy (PWE) can become free of seizure.² However, epilepsy is also an important cause of premature death.³ Mortality rates of people with epilepsy are higher than for the general population.⁴⁻⁹ A longitudinal cohort study from Sweden found that an epilepsy diagnosis was associated with a 14-fold increased risk of all-cause death.⁵ Some studies suggest that this has not changed over time.^{4 10} Other data suggest the number of deaths in PWE is increasing despite a decrease in all-cause mortality in the general population.^{8 11 12} Public Health England reported that deaths with epilepsy as a contributing factor increased by 70% between 2001 and 2014, while all-cause deaths in the population decreased by 6%.¹¹

Some causes of death in PWE are similar to the general population, such as circulatory and respiratory diseases, dementia, Alzheimer's and cancers.^{11 13 14} Others are related to consequences of the condition itself such as injuries, burns and drowning during seizures.^{5 9 15} Lifestyle and psychosocial factors contribute to increased risk of mortality and include alcohol or substance misuse,^{13 16} low adherence to medication,¹⁰ depression,^{5 16} and socioeconomic status.^{11 16} Sudden unexpected death in epilepsy (SUDEP) is sometimes posited as a common cause of death for PWE. A recent review suggests SUDEP accounts for 12% of all-cause deaths in epilepsy.¹⁰ However, factors that can be prevented or treated are under-researched and could lead to more impact on reducing mortality.

In 2011, our group published risk factors increasing mortality in PWE based on population data collected in primary care in the United Kingdom (UK) between 1993 and 2007.¹⁶ Here, we follow-up on the analysis using data collected during an incentivised programme which rewarded enhanced monitoring and care for people with epilepsy in primary care over ten years. We hypothesised that the epilepsy data collected under this programme would be of high quality allowing for a comprehensive analysis of causes and risk factors associated with mortality. We report the number of deaths recorded during this time, the causes of death for younger and older PWE, and risk factors associated with mortality among PWE.

METHODS

Study Design

A retrospective cohort design was used to analyse mortality and causes of death in PWE. Risk factors affecting mortality were analysed using a nested case-control study. This study was approved by the Independent Scientific Advisory Committee of the CPRD (protocol 17_208R2).

Setting

Data was obtained from the Clinical Practice Research Datalink (CPRD). This database contains anonymised patient data obtained from electronic records from primary care clinics in the UK. The data is sent from participating clinics to a central server where data is cleaned, checked for quality and curated. A study from 2015 counted 11,299,221 patients registered in the CPRD from 674 GP practices.¹⁷ Patients in the database were representative of the UK population when compared to the 2011 census.¹⁷ For our study period, mid-year counts for 2004 show 4,584,065 patients were active in the database (alive and currently registered in a GP practice) with 50.1% being female. In 2013, 4,493,034 patients were active at mid-year and 50.4% were female.

1
2
3 Our study period was from 01/04/2004 to 31/03/2014 during which epilepsy management came
4 under the Quality and Outcomes Framework (QOF), a programme implemented within the primary
5 care setting. Revised QOF clinical indicators were implemented in April 2014 when most epilepsy
6 indicators were discontinued. The aim of the programme was to incentivize improvement in the
7 recording of clinical information on specific lifestyle items or long term health conditions with the view
8 that structured monitoring and reporting improved the quality of care.¹⁸
9
10

11 **Types of data**

12
13 The CPRD includes “patient data” which include demographic information, “clinical data” include
14 information on clinical events such as diagnosis or symptoms, and “additional clinical details” that
15 include lifestyle factors. It also includes “therapy data” which contains information on prescriptions,
16 product codes, doses and treatment schedules. Clinical data are entered initially as alpha numeric
17 Read codes by the GP into electronic medical records. These are converted into numeric Medcodes
18 within the CPRD for easier analysis by researchers. Medication types are recorded in “therapy data”
19 as numeric Procodes.
20
21

22 Cause of death information was obtained when available through linked data for a subset of patients
23 from England and Wales from the Office of National Statistics (ONS). The cause of death is presented
24 using ICD-10 diagnostic codes and offers the main cause and up to 15 contributing causes, if
25 applicable. Date of death was available both from the CPRD and ONS data and the earliest date of the
26 two was used if there were discrepancies. The Index of Multiple Deprivation (IMD) was also obtained
27 for each patient’s GP practice, which was used for control matching in the case-control study. Practice
28 IMD data was “most up to date” version when requested in 2018.
29
30

31 **Cohort study participants**

32
33 For the mortality and cause of death cohort study, adults with epilepsy were included who were least
34 18 years old at time of death. Epilepsy was defined as having a documented epilepsy diagnostic code
35 or seizure code and at least two prescriptions of antiepileptic drugs (AEDs). Using a diagnostic or
36 seizure code with prescription data has been validated to identify cases of epilepsy in routinely
37 collected data.¹⁹ Any patient with a diagnostic code of “epilepsy resolved” was removed from the
38 study (Medcodes 8385 and 12848, Read codes 2126000 and 212J.00). Codes used to identify epilepsy
39 and seizures are presented in Table S1 (Supplemental File 1).
40
41

42 **Case-control study participants**

43
44 Since we were focusing on the specific 12-month period prior to date of death to establish preventable
45 risk factors, we opted to use a nested case-control study design. Cases were defined as PWE within
46 the cohort with a documented date of death between 01/04/2004 to 31/03/2014 with at least 12
47 months of data recorded in our study period (thus earliest data of death included was 01/04/2005).
48 Controls were randomly matched at a ratio of 3:1 by sex, practice IMD, year of birth (+/- 1 year). For
49 cases aged 18, controls were matched for year of birth + 1 year. Controls were alive for at least 12
50 months after the date of death of their matched case. The first analysis was conducted for the whole
51 dataset and a second one used data from PWE under the age of 35.
52
53

54 **Exposure variables**

55
56 Potential variables were selected based on existing literature, items part of the QOF and others
57 associated with lifestyle. Exposure data were refined based on the availability and reliability of data in
58 the CPRD. Full description of variables and sources of data are included in the Supplemental File 1. List
59 of codes used for each variable can be found in Supplemental File 2. We assessed variables occurring
60

1
2
3 in the 12 months prior to the case's date of death for emergency department visits or emergency
4 admissions, number of AEDs, status epilepticus, depression, injury, smoking status, and seizure
5 freedom. History of co-morbidity was taken from all available patient data for dementia and stroke.
6 Missing data was considered as "no" for binary outcomes except for smoking status where the last
7 known status was used, as previously reported.²⁰ Variables that were considered but not included due
8 to poor quality of data included alcohol and substance use.
9

10 11 **Statistics**

12
13 The number all-cause deaths recorded in the CPRD was calculated for complete calendar years (from
14 2005 to 2013) to allow for comparisons with previous publications. All other analyses used data from
15 the full study period (01/04/2004 to 31/03/2014). The cause of death data was analysed two ways: 1)
16 tabulating the main cause of death in PWE and 2) evaluating the proportion of deaths with epilepsy
17 listed as a contributing cause. A contributing cause was defined as either the main cause or listed as a
18 cause in any of the other 15 positions on the death certificate. The main causes of death are presented
19 for younger and older PWE with 65 years as the cut-off. Deaths with epilepsy as a contributing cause
20 were divided by age group. To track trends, an additional analysis of main cause of death by full
21 calendar year is presented in supplemental material (Table S2, Supplemental File 1).
22

23
24 Conditional logistic regression was used for the nested case-control study. Variables were included in
25 the model following maximum likelihood and Akaike information criterion (AIC) testing. Potential
26 confounders such as age, sex, and deprivation were addressed by control matching. Data are
27 presented as odds ratios (ORs) and 95% confidence intervals. The analysis was conducted for the
28 whole dataset and subsequently for the subset of PWE aged under 35.
29

30
31 The following interactions were tested: age and emergency visit/admission, age and injury, age and
32 dementia, age and stroke, status epilepticus and emergency visit/admissions, number of AEDs and
33 seizure freedom, prescription issue and number of AEDs, injury and emergency visit/admission.
34

35 **Patient and Public Involvement**

36
37 Patients or the public were not involved in the design, or conduct, or reporting, or dissemination plans
38 of our research.
39

40 41 42 **RESULTS**

43
44 We obtained a sample size of 70,431 PWE with 11,241 who had a documented date of death within
45 our time frame (Figure 1). We obtained cause of death for 7,405 people from ONS linked data. Age of
46 patients ranged 18 to 105 with 50.8% male.
47

48 **Number of deaths**

49
50 The number of deaths recorded in the database increased between 2005 to 2013, from 821 to 1,386
51 which represents a 68.8% increase (Table 1). This increase was not attributed to more PWE being
52 registered in the database as this decreased by 21.8% over the same period. The mean age of the
53 participants within the database increased over time.
54

Table 1. Number of recorded deaths of PWE in the CPRD per full year within the study period.

| | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 |
|--|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| Average age of adult PWE in the database, mean (SD) | 48.7 (18.5) | 49.0 (18.6) | 49.3 (18.6) | 49.6 (18.6) | 49.9 (18.6) | 50.2 (18.6) | 50.5 (18.6) | 50.8 (18.6) | 51.2 (18.6) |
| Number of PWE registered in the database | 48,447 | 48,585 | 48,031 | 46,948 | 45,941 | 44,485 | 42,521 | 40,120 | 37,865 |
| Number of recorded deaths | 821 | 1,075 | 1,190 | 1,241 | 1,214 | 1,307 | 1,282 | 1,386 | 1,386 |
| Number of deaths per 1000 PWE in the CPRD | 16.9 | 22.1 | 24.8 | 26.4 | 26.4 | 29.4 | 30.1 | 34.5 | 36.6 |

Note: PWE defined as having an epilepsy diagnostic code and at least two prescriptions of AEDs, aged >17. Study period was from 1st April 2004 to 31st March 2014. Only data from full calendar years within this time frame were used for this table.

Cause of death

The main causes of death for PWE aged 18 to 64 years old were neoplasms (26.8%), diseases of the circulatory system (15.4%) and epilepsy (14.2%) (Table 2a). For PWE 65 years and over, the main causes of death were diseases of the circulatory system (37.3%), neoplasms (17.2%) and diseases of the respiratory system (15.6%) (Table 2b). Deaths due to epilepsy as a primary cause were documented in 2.7% of older PWE.

Table 2a. Documented main cause of death of people with epilepsy under 65 years

| ICD-10 category | Under 65, n (%) |
|---|-----------------|
| Neoplasms (C00-D48) | 571(26.9) |
| Diseases of the circulatory system (I00-I99) | 330 (15.6) |
| Epilepsy (G40-G41) | 302 (14.2) |
| Diseases of the respiratory system (J00-J99) | 176 (8.3) |
| Diseases of the nervous system (G00-G37, G43-G99), excluding epilepsy | 164 (7.7) |
| Diseases of the digestive system (K00-KK93) | 161 (7.6) |
| External causes of morbidity and mortality (V01-X59, X85-Y98) | 129 (6.1) |
| Congenital malformations, deformations and chromosomal abnormalities (Q00-Q99) | 70 (3.3) |
| Mental and behavioural disorders (F00-F99) | 61 (2.9) |
| Endocrine, nutritional and metabolic diseases (E00-E90) | 34 (1.6) |
| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99) | 29 (1.4) |
| External causes of morbidity and mortality (intentional) (X60-X84) | 28 (1.3) |
| Diseases of the genitourinary system (N00-N99) | 23 (1.1) |
| Certain infectious and parasitic diseases (A00-B99) | 20 (0.9) |

| | |
|--|----------------------|
| Diseases of the blood and blood-forming organs (D50-D89) | 9 (0.4) |
| Diseases of the musculoskeletal system and connective tissue (M00-M99) | 9 (0.4) |
| Diseases of the skin and subcutaneous tissue (L00-L99) | 4 (0.2) |
| Total | 2,120 (100.0) |

Table 2b. Documented main cause of death of people with epilepsy aged 65 and over

| ICD-10 category | 65 and over, n (%) |
|---|----------------------|
| Diseases of the circulatory system (I00-I99) | 1973 (37.3) |
| Neoplasms (C00-D48) | 910 (17.2) |
| Diseases of the respiratory system (J00-J99) | 827 (15.6) |
| Mental and behavioural disorders (F00-F99) | 479 (9.1) |
| Diseases of the nervous system (G00-G37, G43-G99), excluding epilepsy | 295 (5.6) |
| Diseases of the digestive system (K00-KK93) | 173 (3.3) |
| Epilepsy (G40-G41) | 142 (2.7) |
| Diseases of the genitourinary system (N00-N99) | 130 (2.5) |
| External causes of morbidity and mortality (V01-X59, X85-Y98) | 88 (1.7) |
| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99) | 86 (1.6) |
| Endocrine, nutritional and metabolic diseases (E00-E90) | 67 (1.3) |
| Certain infectious and parasitic diseases (A00-B99) | 46 (0.9) |
| Diseases of the musculoskeletal system and connective tissue (M00-M99) | 29 (0.5) |
| Congenital malformations, deformations and chromosomal abnormalities (Q00-Q99) | 15 (0.3) |
| Diseases of the skin and subcutaneous tissue (L00-L99) | 13 (0.2) |
| Diseases of the blood and blood-forming organs (D50-D89) | 8 (0.2) |
| External causes of morbidity and mortality (intentional) (X60-X84) | 4 (0.1) |
| Total | 5,285 (100.0) |

We tabulated the number of deaths with epilepsy listed as a cause of death, either the main or a contributing cause (Table 3). In PWE under 35, almost 45% of deaths had epilepsy as a contributory cause (35.1% to 53.3%, with a mean of 44.2%) (Table 3). The trends are similar between sexes under 35 and over 65. However, they differ in middle-age. At the 40-44 age group, epilepsy-contributing deaths were 2-fold higher in male compared to female PWE.

Table 3. Epilepsy documented as a contributing cause of death by age group

| Age group | Male | | Female | |
|-----------|---------------------|---|---------------------|---|
| | All cause deaths, n | Deaths with epilepsy as contributing cause, n (%) [95% Confidence Interval] | All cause deaths, n | Deaths with epilepsy as contributing cause, n (%) [95% Confidence Interval] |
| 18-19 | 15 | 8 (53.3) [28.1 – 78.6] | 8 | 3 (37.5) [4.0 – 71.0] |
| 20-24 | 37 | 17 (45.9) [29.9 – 62.0] | 29 | 13 (44.8) [26.7 – 62.9] |
| 25-29 | 45 | 22 (48.9) [34.3 – 63.5] | 37 | 17 (45.9) [29.9 – 62.0] |
| 30-34 | 64 | 27 (42.2) [30.1 – 54.3] | 37 | 13 (35.1) [19.8 – 50.5] |
| 35-39 | 81 | 19 (23.5) [14.2 – 32.7] | 62 | 17 (27.4) [16.3 – 38.5] |
| 40-44 | 135 | 44 (32.6) [24.7 – 40.5] | 75 | 12 (16.0) [7.7 – 24.3] |

| | | | | |
|--------|-----|-------------------------|-----|-------------------------|
| 45-49 | 157 | 42 (26.8) [19.8 – 33.7] | 104 | 18 (17.3) [10.0 – 24.6] |
| 50-54 | 213 | 58 (27.2) [21.3 – 33.2] | 114 | 19 (16.7) [9.8 – 23.5] |
| 55-59 | 238 | 44 (18.5) [13.6 – 23.4] | 165 | 23 (13.9) [8.7 – 19.2] |
| 60-64 | 291 | 63 (21.6) [16.9 – 26.4] | 213 | 36 (16.9) [11.9 – 21.9] |
| 65-69 | 323 | 42 (13.0) [9.3 – 16.7] | 266 | 38 (14.3) [10.1 – 18.5] |
| 70-74 | 442 | 60 (13.6) [10.4 – 16.8] | 295 | 34 (11.5) [7.9 – 15.2] |
| 75-79 | 475 | 44 (9.3) [6.7 – 11.9] | 444 | 57 (12.8) [9.7 – 15.9] |
| 80-84 | 517 | 53 (10.3) [7.6 – 12.9] | 578 | 68 (11.8) [9.1 – 14.4] |
| 85-89 | 485 | 54 (11.1) [8.3 – 13.9] | 623 | 62 (10.0) [7.6 – 12.3] |
| 90-105 | 290 | 22 (7.6) [4.5 – 10.6] | 547 | 65 (11.9) [9.2 – 14.6] |

To explore whether there were changes in the causes of death over time, we tabulated the main cause of death by year (Supplementary File 1, Table S2). Diseases of the circulatory system were consistently listed as the highest main cause of death for each year. The proportion of deaths due to mental and behavioural disorders doubled from 2011 onwards (mean percentage for 2005 to 2010: 5.05%, mean percentage for 2011 to 2013: 10.7%). The proportion of deaths attributed to epilepsy as the primary cause remained relatively stable throughout (6.3% for 2005 to 5.2% for 2013), although the number of deaths this represented increased (33 in 2005 to 51 to 2013).

Risk factors

Risk factors included in the model, frequencies and associated ORs are presented in Table 4. Attendance at emergency departments in the previous 12 months was associated with the highest risk (OR: 3.48 CI: 3.19 – 3.80). Compared to being prescribed one AED, prescription of two or more AEDs was associated with an elevated risk of death (2 AEDs: OR: 1.60 CI: 1.51 – 1.71; 3 AEDs: OR: 2.06 CI: 1.86 – 2.29; 4+ AEDs: OR: 2.62 CI: 2.23 – 3.08), while no AED prescription was associated with a lower risk (OR: 0.77 CI: 0.68 – 0.87) (Table 4). Other factors associated with an increased risk of mortality included experiencing status epilepticus within the past 12 months (OR: 2.78 CI: 1.64 – 4.71), depression (OR: 1.67 CI: 1.57 – 1.76), smoking (OR: 1.45 CI: 1.35 – 1.56), injury (OR: 1.54 CI: 1.43 – 1.67), and history of dementia (OR: 1.39 CI: 1.26 – 1.53) and stroke (OR: 1.07 CI: 1.01 – 1.14).

A lower risk of death was associated with seizure freedom in the previous 12 months (OR: 0.52 CI: 0.41 – 0.65).

We found an interaction between having an emergency department visit or emergency admission and injury (OR: 0.59 CI: 0.48 – 0.70).

As the cohort analysis of cause of death revealed epilepsy was a significant contributing factor of the cause of death in young PWE, we repeated the risk factor analysis for PWE aged under 35. Significant risk factors associated with risk of death included emergency department visit (OR: 3.90 CI: 2.44 – 6.23), number of AEDs (No AEDs: 0.42 CI 0.21 – 0.84, 2 AEDs: OR: 1.72 CI: 1.23 – 2.40; 3 AEDs OR: 2.37 CI 1.52 – 3.67, 4+ AEDs: OR: 3.76 CI: 2.26 – 6.26), injury (OR: 1.99 CI: 1.19 – 3.31) and seizure freedom (OR: 0.17 CI 0.02 – 1.44).

Table 4. Risk factors Increasing mortality in PWE

| Factor | Group | All | | | | Age < 35 | | | |
|---|------------|----------------|--------------|------------|-------------------------|----------------|-------------|------------|-------------------------|
| | | Controls n (%) | Cases n (%) | Odds Ratio | 95% Confidence interval | Controls n (%) | Cases n (%) | Odds Ratio | 95% Confidence interval |
| Emergency department visit or emergency admission | no | 25,712 (94.2) | 7,469 (82.1) | reference | | 875 (95.9) | 252 (82.9) | reference | |
| | yes | 1,576 (5.8) | 1,627 (17.9) | 3.48 | 3.19 - 3.80 | 37 (4.1) | 52 (17.1) | 3.90 | 2.44 – 6.23 |
| Number of AEDs prescribed | 0 | 1,667 (6.1) | 353 (3.9) | 0.77 | 0.68 - 0.87 | 107 (11.7) | 10 (3.3) | 0.42 | 0.21 – 0.84 |

DISCUSSION

We examined the causes of death among PWE and risk factors associated with mortality in a group of PWE derived from primary care data. The number of PWE with recorded deaths increased throughout our 9-year study period while the deaths attributed to epilepsy remained stable. In our model, we found important factors associated with a higher risk of mortality, some of which could be identified and potentially ameliorated by step-up care.

There were differences in the proportion of deaths attributed to epilepsy between younger and older PWE. Studies have found deaths of younger PWE are more often attributed to epilepsy.^{21 22} Indeed, epilepsy was the third highest main cause of death in younger PWE in our study, accounting for almost 15% of deaths. This increased to 35-50% when evaluating all contributing causes in age groups under 35. As younger PWE tend to have less co-morbidity than older adults, it may be simpler to attribute epilepsy as the main cause of death. New diagnoses of epilepsy in people over 65 are often secondary to cerebrovascular disease such as stroke or neoplasms in the brain.²³ In our study, dementia was found to increase the risk of death, which has been found to share biological links with epilepsy.²⁴ New onset epilepsy in older people tends to be better controlled with AEDs.²⁵ Thus, other co-morbidity may take precedence in older PWE when documenting the cause of death, as epilepsy contributed to only about 10% of deaths and was listed as a main cause in 3%.

Factors associated with increased risk of death

Our findings support evidence from previous studies. Factors associated with risk of mortality in epilepsy included: depression,^{5 16 26} injuries,^{3 5 9 16 27} dementia and stroke,^{13 28} age,¹³ and seizure freedom.^{3 13 15 16} Novel findings include increased risk associated with emergency department visits and/or emergency admissions, prescription of more than one AED, and status epilepticus. Status epilepticus is a known cause of death,^{13 22 29} however, to our knowledge, it has not been included within a risk model before.

For the younger PWE group, emergency visit or emergency admissions, number of AEDs and injury were associated with higher risk of death. While, like the wider-sample, seizure freedom was associated with a lower risk of death.

Clinical Implications

Epilepsy management

The need for better epilepsy management is at the core of our findings. Several risk factors are linked within this theme such as emergency department attendance, polypharmacy, injury, and seizure freedom.

Visits to emergency departments or emergency admissions were associated with a 3-fold increased risk of death, the highest risk in our model. Visits to emergency services are associated with having injuries,³⁰ experiencing a seizure or a change in normal seizure presentation,³¹ and having less confidence in self-management.³² Attendance at emergency departments for epilepsy could thus be considered a surrogate marker for poorer epilepsy control.³³ The National Audit of Seizure management in Hospitals (NASH), conducted during our study period in 2011 and 2013, found 63% of PWE presenting to emergency departments for seizures had not been seen by a specialist in the previous year.³⁴ Moreover only half of attendees were either seen by a neurologist on site or referred to one upon discharge.³⁴ These are missed opportunities to follow-up with patients who may be in need of clinical review and help with self-management, to mitigate their greater risk of death.

Areas for possible intervention

Regular medication review for people on multiple AEDs may be important as increased mortality risk was associated with two or more AEDs. Prescriptions of multiple AEDs may be an effect of having more refractory and harder to control epilepsy. However, polypharmacy may also result in more side-effects and different treatment schedules which could lead to more problems with medication adherence.³⁵

Depression has been reported in about 25% of PWE.^{36 37} In our study, we found 30% of cases and 20% of controls had either a diagnosis of depression or a prescription of anti-depressants. Depression and other psychiatric disorders have been found to be associated with worse quality of life³⁸ and affect self-management.³⁹ Many PWE have said they do not feel their mental health needs are being addressed and thus depression may be underassessed in this patient group.⁴⁰ As the proportion of deaths with psychiatric illness as a main cause increased 2-fold in our study period, psychiatric assessment and management should be provided for people with epilepsy.

Ultimately, the goal of better epilepsy management is seizure reduction or seizure freedom. Seizure freedom was associated with approximately a 50% reduced risk of mortality in our model. Previous findings showed seizure freedom conveyed similar mortality rates for PWE as those observed in the general population.¹⁵

Other factors

We explored lifestyle factors which may be associated with increased mortality and found smoking to be associated with a higher risk. Other findings may be less amenable to change, although some intervention may be helpful. For example, experiencing status epilepticus in the previous 12 months was associated with a higher risk of death. In epilepsy, it is most often associated with low blood levels of AEDs or alcohol misuse.⁴¹ Injury to the brain (trauma, hypoxia, anoxia), tumours, infections and stroke can also trigger status epilepticus and thus it may not be preventable.⁴¹

Strengths and limitations

The CPRD contains data collected from primary care which is vast and increased the generalisability of results as all participating UK practices were included. However, we relied on clinical data which has some limitations as compared to epidemiological studies. It is possible that a small number of cases might have been misclassified as having epilepsy but our case definitions of an epilepsy diagnostic code and AED prescription have been validated and used in previous studies.^{16 19 42} Conversely, patients who presented to emergency departments or were managed only by hospital specialists might not have been included.

The quality of information in the CPRD is dependent on data entered by practice staff during consultations for clinical use, not for research purposes. Items not applicable for a patient may be left off, rather than recorded as such. In the case of diagnosis, there is no option for a GP to enter an absence of diagnosis. Missing data in routine primary care databases are not missing at random and thus statistical methods of dealing with missing data, such as multiple imputation, may not be appropriate.^{43 44} For this reason, we interpreted missing data as “no” or “no complication”, however we recognise this may be a limitation for some factors. Other limitations include not knowing the cause of injuries or hospital attendance and thus they may be unrelated to epilepsy.

We defined the exposure variables based on previous studies, if available.^{16 20 45} The CPRD information has been validated for long term-conditions, such as dementia and Alzheimer’s disease, and for diagnoses made by hospital consultants.⁴⁶ As GPs issue prescriptions via electronic systems, the CPRD “therapy data” has been found to be highly accurate for medication variables.⁴⁷ However, we included

1
2
3 variables which may not have been previously validated such as injury and emergency department
4 visit or emergency admission which is a limitation of this study. We explored other factors such as
5 severe mental illness, self-injury, patient-level index of multiple deprivation, alcohol use, substance
6 use, pregnancy and learning disability. These were found statistically not significant and not included
7 in the final overall model or the under-35 model. We also investigated interactions between variables.
8 While we found a significant interaction between emergency admissions and injuries, we did not find
9 one with status epilepticus. This suggests that status epilepticus might have been under recorded as
10 a reason for emergency department visits, and perhaps entered under a more general “epilepsy” code
11 within GP patient notes. However, these missing episodes of status would be captured by the
12 emergency department admission variable, which was associated with the highest risk of death in our
13 study. We hypothesize that accurate recording of status epilepticus would have further increased its
14 associated risk with mortality.
15
16
17

18 The time frame of our analysis corresponded to the period where epilepsy was part of the Quality and
19 Outcomes Framework, a programme whereby GPs were contracted to record specific characteristics
20 of their patients with epilepsy.⁴⁸ In particular, data on drug treatment, seizure frequency and seizure
21 freedom were part of this programme.⁴⁸ We hypothesized that this would lead to better quality data
22 for epilepsy and strengthen the study. While the data collected may be more complete than years
23 prior, GP practices were less successful in achieving targets for epilepsy compared to other conditions,
24 some of which are more highly rewarded.^{48 49} Older data may contain outdated diagnoses of epilepsy
25 which may not have been reconfirmed by today’s standards, and if in remission, might not have been
26 designated with an epilepsy resolved code. This could lead to missing epilepsy data. However, the
27 strength of the CRPD is the vast data collected from the community setting compared to hospital
28 databases or disease specific registers.^{19 42}
29
30
31

32 A limitation of our cohort study is the use of linked ONS data, which is only available for consenting
33 individuals from England and Wales. Thus, data was not available for our whole cohort, and findings
34 are not generalisable to Scotland and Northern Ireland. Death certificate data for epilepsy has often
35 been found to be problematic. A 2002 audit of UK data found up to 40% of deaths were attributed to
36 the wrong cause for PWE.⁵⁰ Epilepsy tends to be underestimated as a cause of death^{8 26} and dismissed
37 for other cardiovascular or respiratory explanations.^{21 26 51} Indeed, we found other diseases were listed
38 as primary cause of death which may in fact have been epilepsy. The percentage of deaths with
39 epilepsy as a main cause remained stable throughout our study, suggesting that practice may not have
40 changed during this time.
41
42
43

44 **Research Implications**

45 Our initial risk factor model took into account PWE of all ages. However, as the main causes of death
46 differ between younger and older PWE, risk factors may also be different. Thus, we repeated the
47 analysis including PWE under the age of 35. Fewer of the variables were included in this model with
48 the main differences being in lower ORs for having no AED prescription and being seizure free. The
49 highest excess mortality due to epilepsy has been observed in younger people.¹⁵ This would benefit
50 from more research aiming to identify specific risks in younger PWE, particularly as we found epilepsy
51 contributed to close to 50% of deaths in some younger age groups. We also did not evaluate potential
52 causes of epilepsy, such as whether stroke or tumours preceded an epilepsy diagnosis, and whether
53 this would impact mortality. In addition, the analysis may benefit from being repeated with more
54 recent data from the CPRD and ONS.
55
56
57
58
59
60

CONCLUSION

Several reports, including ours, have shown deaths in epilepsy continue to rise. Epilepsy is deemed a contributing cause of death particularly in young PWE, but less so in those over 65. While epilepsy in older people may be better controlled with AEDs, co-morbidity may mask the impact of epilepsy. We found certain factors are associated with risk of death such as emergency department attendance for epilepsy and admission, AED polytherapy, depression, and injuries. These could be addressed with clinical intervention and more information for self-management.

FUNDING

This work was partly funded by SUDEP Action (award number not applicable).

AUTHOR CONTRIBUTIONS

GW conducted the study, statistical analysis, and write-up of manuscript. MG contributed to the study design, supported the statistical analysis, and write-up. MA contributed to the study design and write-up. MPR contributed to study design. LR contributed to the study design, interpretation, and write-up of findings.

COMPETING INTERESTS

The authors declare no competing interests.

DATA SHARING STATEMENT

This study uses data that is obtained from the CPRD. Requests for data must be approved via the CPRD's Research Data Governance process (formerly the Independent Scientific Advisory Committee).

ETHICS STATEMENT

This study was approved by the CPRD Independent Scientific Advisory Committee (protocol reference: 17_208R2).

Definition of variables

Lists of Medcodes and corresponding Read codes used for each variable can be found in Supplemental file 2. An initial list of Read codes was created for each variable, either based on previous research or by searching specific words in a Read code browser. Medcodes were matched to the Read code list using the CPRD Medical Dictionary. An additional search of the Medcodes was conducted to ensure all appropriate codes were used. Medcodes were used during the analysis in STATA as these are numeric codes. For variables using medication data, lists of prodcodes were generated by searching the CPRD product code list, which lists prodcodes against British National Formulary (BNF) information.

- **Age:** For cases: age = year of death – year of birth. For matched controls: age = year of death of the matched case – year of birth.

For epilepsy related factors (ie. Relating to seizures and treatment) and lifestyle factors, data from the CPRD was used from the date of death of the matched case up to 12 months prior. These variables are listed below:

- **Emergency department visit or emergency admission:** Emergency admissions or visits to emergency centres were identified from “Clinical data” from CPRD. These included keywords: seen by emergency clinician, in accident and emergency, emergency admission. A full list is available in Supplemental File 2.
- **Number of antiepileptic drugs (AEDs):** Number of different types of AEDs prescribed in 12 months were grouped into categories: 0, 1, 2, 3 and “4 or more”. Product codes (“Prodcodes”) were used from “Therapy data” to identify AEDs in the CPRD. A full list of Prodcodes and corresponding definitions is available in Supplemental File 2.
- **Status epilepticus:** recorded status epilepticus code in previous 12 months (medcode: 4093; readcode: F253.11) clinical CPRD data.¹
- **Depression:** the variable was coded as either a documented diagnostic medcode related to “depression” from “Clinical data” or a prescription of antidepressants from “Therapy data” in the previous 12 months.¹ Antidepressants were identified through their product codes (prodcode) from therapy data. A list of medcodes for depression and prodcodes for antidepressants can be found in Supplemental File 2.
- **Smoking status:** Data was coded from medcodes related to smoking or smoking cessation interventions from “Clinical data” and overall smoking status if available in the CPRD “Additional Files”. For any patients that did not have a smoking status recording in the 12-month data period, the last known recording from clinical data was used, as previously described by Booth et al.² The list of medcodes and readcodes used to identify smoking status can be found in Supplemental File 2.
- **Injury:** any injury documented in “Clinical data” was used. A list of medcodes from clinical CPRD data included: injuries, fractures, dislocations, burns, bruising, contusions, lacerations, abrasions, concussions and wounds.¹ A full list of medcodes and corresponding Read codes can be found in Supplemental File 2.
- **Seizure freedom:** recoded seizure freedom for > 12 months (medcode: 11015; readcode: 667F.00) in “Clinical data” from CPRD.¹

For co-morbidity, data coded for patient’s lifetime (within start and end dates with acceptable quality data recording):

- **Dementia:** code list included any medcodes for “dementia” and “Alzheimer’s” in patient history from “Clinical data” in the CPRD. The list of medcodes and corresponding Read codes can be found in Supplemental File 2.

STROBE Statement—checklist of items that should be included in reports of observational studies

| | Item No | Recommendation | Page No |
|---------------------------|---------|--|---------------------------------|
| Title and abstract | 1 | (a) Indicate the study's design with a commonly used term in the title or the abstract | 1 |
| | | (b) Provide in the abstract an informative and balanced summary of what was done and what was found | 2 |
| Introduction | | | |
| Background/rationale | 2 | Explain the scientific background and rationale for the investigation being reported | 4 |
| Objectives | 3 | State specific objectives, including any prespecified hypotheses | 4 |
| Methods | | | |
| Study design | 4 | Present key elements of study design early in the paper | 4,5 |
| Setting | 5 | Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection | 4,5 |
| Participants | 6 | (a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants | 5 |
| | | (b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case | 5 |
| Variables | 7 | Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable | 5, 6 supplemental file 1 and 2 |
| Data sources/measurement | 8* | For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group | 5, 6, supplemental file 1 and 2 |
| Bias | 9 | Describe any efforts to address potential sources of bias | N/A |
| Study size | 10 | Explain how the study size was arrived at | 5,6 |
| Quantitative variables | 11 | Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why | 5,6 |
| Statistical methods | 12 | (a) Describe all statistical methods, including those used to control for confounding | 6 |
| | | (b) Describe any methods used to examine subgroups and interactions | 6 |
| | | (c) Explain how missing data were addressed | 5 |

(d) *Cohort study*—If applicable, explain how loss to follow-up was addressed

5

Case-control study—If applicable, explain how matching of cases and controls was addressed

Cross-sectional study—If applicable, describe analytical methods taking account of sampling strategy

(e) Describe any sensitivity analyses

60**Results**

| | | | |
|------------------|-----|--|-------------|
| Participants | 13* | (a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed | Fig 1 |
| | | (b) Give reasons for non-participation at each stage | Fig 1 |
| | | (c) Consider use of a flow diagram | Fig 1 |
| Descriptive data | 14* | (a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders | 6 |
| | | (b) Indicate number of participants with missing data for each variable of interest | N/A |
| | | (c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount) | N/A |
| Outcome data | 15* | <i>Cohort study</i> —Report numbers of outcome events or summary measures over time | table 1 - 3 |
| | | <i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure | table 4 |
| | | <i>Cross-sectional study</i> —Report numbers of outcome events or summary measures | |
| Main results | 16 | (a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included | 9,10 |
| | | (b) Report category boundaries when continuous variables were categorized | table 4 |
| | | (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period | N/A |
| Other analyses | 17 | Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses | 9 |

Discussion

| | | | |
|------------------|----|--|-------|
| Key results | 18 | Summarise key results with reference to study objectives | 8,9 |
| Limitations | 19 | Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias | 12,13 |
| Interpretation | 20 | Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence | 10,11 |
| Generalisability | 21 | Discuss the generalisability (external validity) of the study results | 13 |

Other information

| | | | |
|---------|----|---|----|
| Funding | 22 | Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based | 14 |
|---------|----|---|----|

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.
