

Supplementary Fig. 3. The plotALL function of surviALL calculating hazard ratios (HR) (y-axis) for all possible IL11 cut-points to be examined. TCGA breast cancer patients ordered by increasing expression of IL11 (x-axis). The color bar gradient stands for range of the most significant points-of-separation of the population (low-high significance = blue-yellow gradient) based on IL11 expression and disease specific survival (DSS), disease-free interval (DFI) and progression-free interval (PFI) of each patient.
