

SUPPLEMENTARY INFORMATION

Table S1. Distribution of first-, second- and third-division metaphases among 1,000 cells in 48-, 52-, and 72-h cultures from two donors.

Table S2. Observed frequency of different arm cohesion phenotypes before and after synchronization.

Table S3. RABiT-II DCA yields after *in vitro* γ -ray irradiation of blood samples derived from four healthy individuals (scored automatically using FluorQuantDic version 3.3).

Table S4. Classical DCA yields and intercellular distribution of dicentric aberrations after *in vitro* γ -ray irradiation of blood samples derived from four healthy individuals (scored manually).

Fig. S1. Representative images of chromosome spreads obtained from asynchronously growing blood cells arrested in metaphase by colcemid. A variety of chromosomal configurations are observed in different metaphases. Panel A: DNA strands are weakly condensed. Panel B: Progressively condensed chromosomes with long length; chromosome arms keep firm connection. Panel C: Arms begin to open due to cleavage and release of cohesin. Panel D: Chromosomes begin to shorten in length by condensing. Panel E: Chromosomes become very short, arms are completely opened and firm connection remains only at the centromere region (“X-shape”). Panel F: Arms and centromeres are split. Panel G: Other phases. (Inserts are published and modified, with permission, from: Rieder CL, Palazzo RE. Colcemid and the mitotic cycle. J Cell Sci 1992; 102 Pt 3:387–92). White dashed boxes are cropped chromosomes used for Fig. 6A.

Fig. S2. Representative examples of chromosome clusters that lead to errors at low doses.
