Table of contents

Section 1: Data source descriptions

Public data sources:

2010 Decennial Census Datasets: Summary Files 1 & 2
Geography: Census Tract
The Decennial Census and the American Community Survey (ACS) are part of the Decennial Census Program of the U.S. Census Bureau. Since 2005, in order to provide communities, businesses and the public with detailed information more frequently, data that were historically collected only once every 10 years by the decennial census long form have been collected monthly (and released annually) through the ACS.
More Information: https://www.census.gov/programs-surveys/acs/data/summary-file.html

2013-2017 American Community Survey 5-year Estimates
Geography: Census Tract
The American Community Survey (ACS) is an ongoing survey that provides data every year -- giving communities the current information they need to plan investments and services. The ACS covers a broad range of topics about social, economic, demographic, and housing characteristics of the U.S. population. The 5-year estimates from the ACS are "period" estimates that represent data collected over a period of time. The primary advantage of using multiyear estimates is the increased statistical reliability of the data for less populated areas and small population subgroups. The 5-year estimates are available for all geographies down to the block group level. In total, there are 87 different summary levels available with over 578,000 geographic areas.
More Information: https://www.census.gov/programs-surveys/acs/technical-documentation/table-and-geography-changes/2017/5-year.html

Social Vulnerability Index (SVI)
Geography: Census Tract
CDC's SVI uses U.S. Census data to determine the social vulnerability of every census tract. Census tracts are subdivisions of counties for which the Census collects statistical data. The SVI ranks each tract on 15 social factors, including poverty, lack of vehicle access, and crowded housing, and groups them into four related themes. Each tract receives a separate ranking for each of the four themes, as well as an overall ranking.
More Information: https://svi.cdc.gov/data-and-tools-download.html

RIGIS
Geography: Point joined to Census Tract
The Rhode Island Geographic Information System (RIGIS) is a consortium promoting the interests of Rhode Island's geospatial community. This group of government and private organizations promotes the use of the latest technology as a means for managing and utilizing a comprehensive database of geographically-related (geospatial) information.The mission of RIGIS is to monitor, coordinate, and provide leadership for activities relating to the use of GIS technology within Rhode Island, to support initiatives that implement or use GIS technology, and to provide easy access to an extensive database of geospatial data for the state.By making this comprehensive collection of geospatial data widely available, RIGIS has become a leader in the United States as an open geospatial data clearinghouse.Through the promotion of a geographic information system (GIS), RIGIS is able to encourage individuals, private businesses, local and state government, K-12 institutions, and colleges and universities to invest in a staff with GIS expertise, the required technology (hardware and software) as a means for enhancing decision-making through the utilization of land-related information such as that provided by RIGIS. When used successfully, GIS can capture, store, manipulate, analyze, manage and present all spatially related data in a variety of ways for any number of disciplines.
More information: http://info.rigis.org/

Private Rhode Island data sources:

Office of the State Medical Examiner (OSME) database
Geography: Point joined to Census Tract
The OSME database includes information collected during medical examiner investigations (including scene investigations, medical record review, and examinations) to determine the cause and manner of death for homicidal, suicidal, accidental (including trauma), sudden, and unexpected natural or undetermined deaths. OSME maintains comprehensive electronic and written records on all autopsies, including toxicology and pathology reports, death certificates, and case investigation summaries. (https://link.springer.com/article/10.1007/s13181-015-0477-9)

OSME's charts contained sociodemographic, incident, autopsy, toxicology, and third party reports of drug use for each decedent. OSME compiled this information from medical examiners' (MEs') reports, toxicology reports, emergency medical services and/or hospital reports, police reports, medical records, and other information provided to or requested by the ME to determine the cause of death. Rhode Island has a centralized ME system. All autopsy reports are reviewed by the Chief ME, who certifies the cause of death based on the advice provided by the lead ME for each case. (https://doi.org/10.1093/pm/pnx015)

Rhode Island Behavioral Health On-Line Data Service (BHOLD)
Geography: Zip joined to Census Tract
All licensed behavioral healthcare organizations (BHOs) are required to submit all of their behavioral healthcare clients' admission, discharge and event data into the State's Behavioral Health On-Line Database (BHOLD). The data should include all elements listed in the BHOLD data dictionary and must be submitted at least monthly. A supplemental Excel file containing ICD-10 diagnosis codes must be sent at the same time as the BHOLD submission.
More information: https://bhddh.ri.gov/sections/reporting.php

Section 2: Dataset preparation

Data from the OSME was first geocoded using exact locations corresponding to the address at which each overdose occurred using ArcGIS software (version 10.4). These address points were then joined to a Census Tract shapefile. Point information from RIGIS data sources was also joined to this shapefile. In Rhode Island, Census Tracts do not uniformly fit into their corresponding Zip Codes. Some Census Tracts may straddle two or more different Zip Codes. To join the BHOLD data to the Census Tract shapefile, a calculation was needed because the original data was at the Zip Code level. A Zip Code shapefile was overlaid on the Census Tract shapefile and a new shapefile was created, containing boundaries from both layers. The values for each Zip Code were then dispersed among intersecting Census Tracts using a percent area calculation. The new values were then aggregated back to the Census Tract layer.

Once all geoprocessing was complete, the resulting table was exported as a CSV. This file was then joined to the 2010 Census, 2013-2017 ACS, and 2016 SVI data using the Census Tract GEOID field. The resulting analytic table was then used to conduct all following analyses.
