Figure S1 A summary of each patient's sample time points.

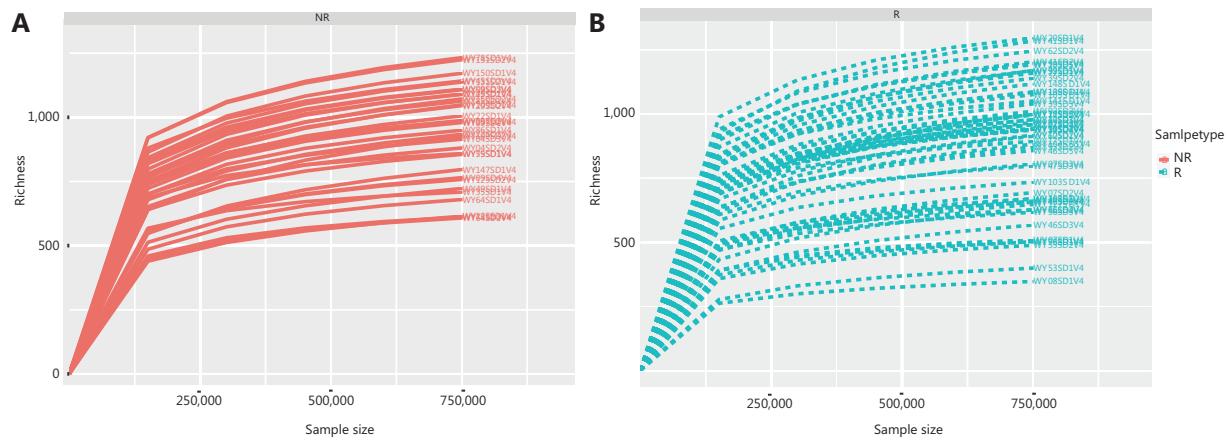

Figure S2 Rarefaction curves of fecal samples using 16S ribosomal RNA gene sequencing from the nonresponder (A) and responder groups (B).

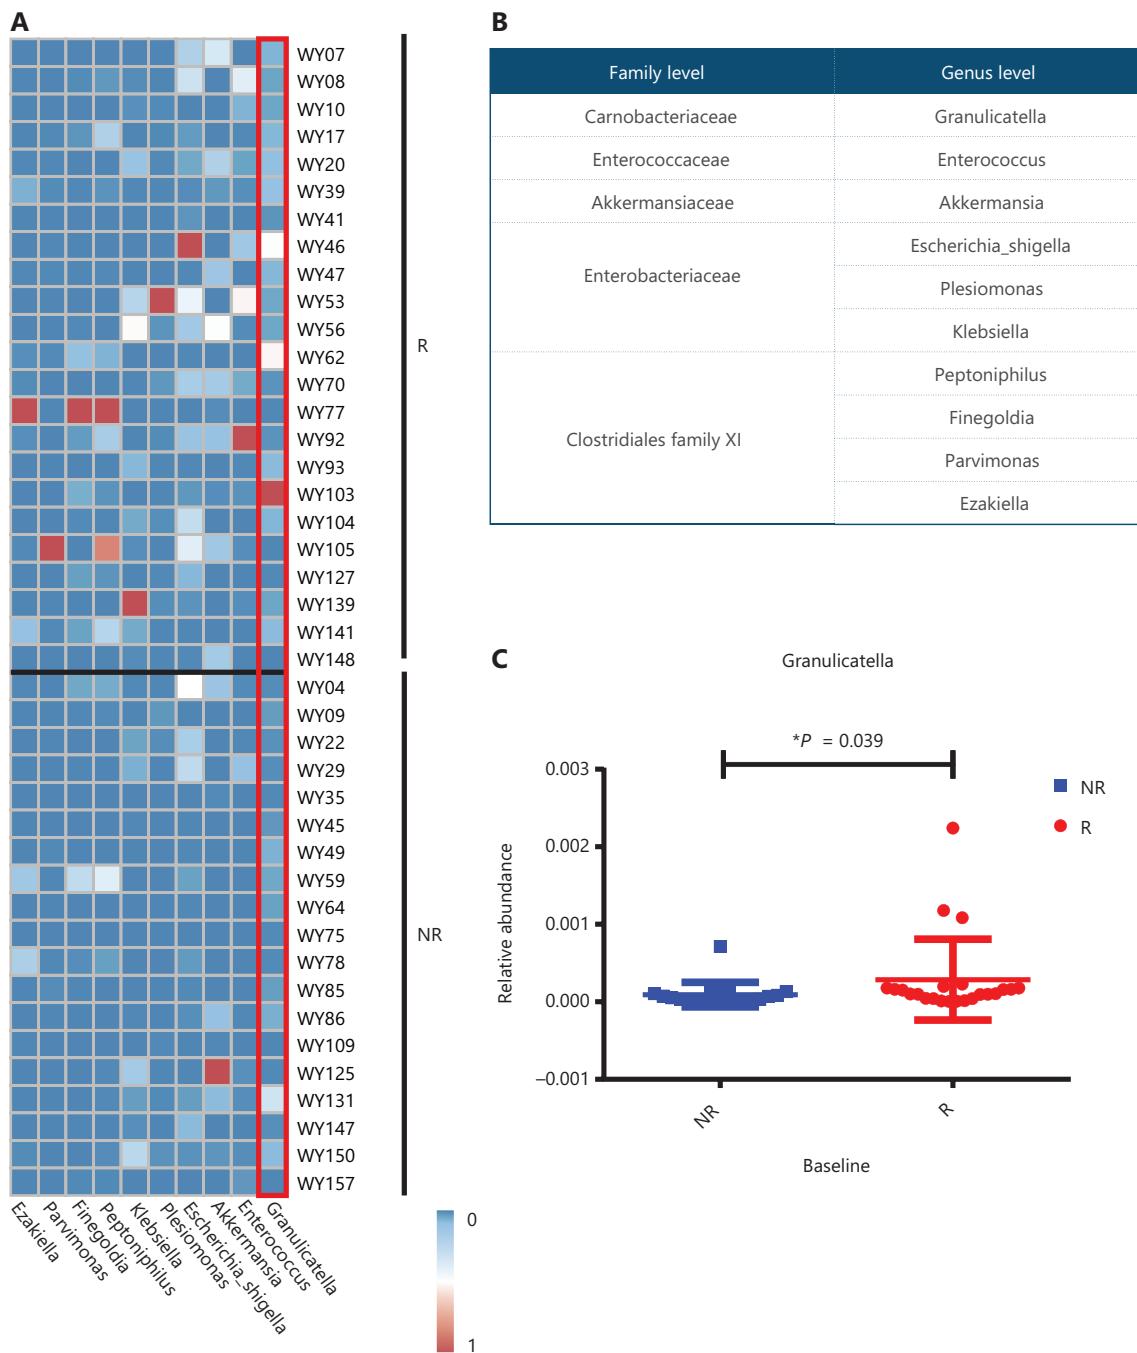

Figure S3 Comparison of 5 bacterial families with different abundances at the genus level. (A) Heat map of the dominant gut microbial genera belonging to the 5 bacterial families. (B) Description of the commensal microbiome summarized at the family and genus levels. (C) Comparison of the *Granulicatella* bacterial genus between responders ($n = 23$) and nonresponders ($n = 19$). Statistical analysis was performed using the Mann-Whitney test. $*P < 0.05$.

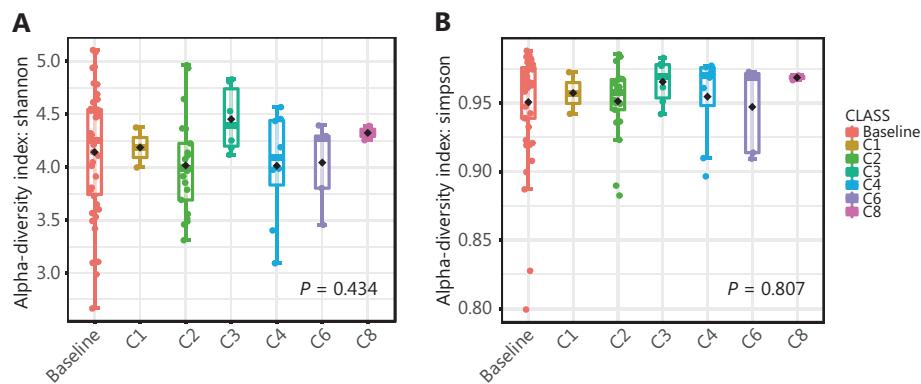

Figure S4 The diversity of the gut microbiome during anti-PD-1 treatment. Dynamics of the Shannon index (A) and Simpson index (B) in longitudinal stool samples. Statistical analysis was performed using the Kruskal-Wallis test. $P > 0.05$ for all tests.

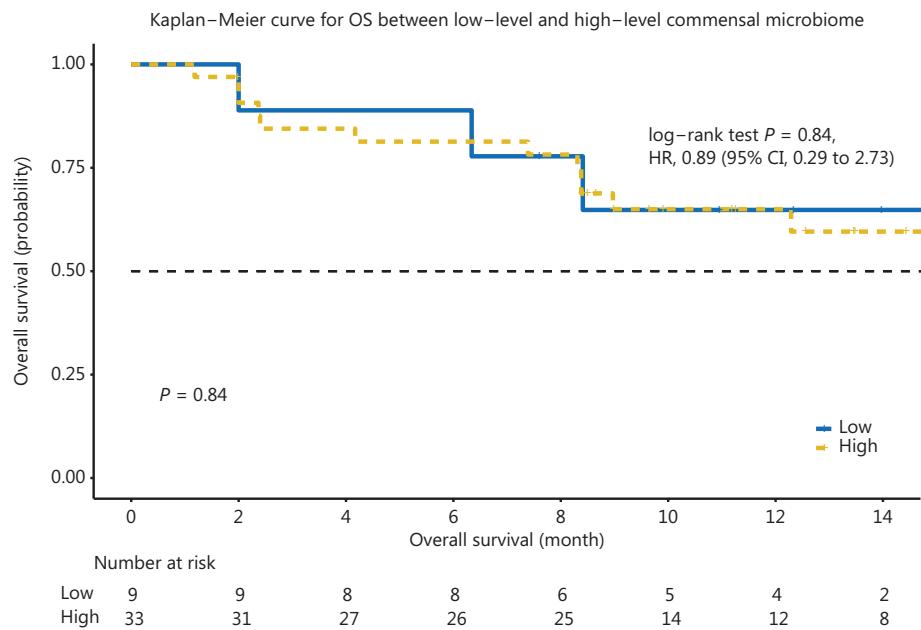

Figure S5 Kaplan-Meier plot of overall survival with log-rank tests in patients treated with immune checkpoint inhibitors, stratified by high versus low levels of the baseline commensal microbes.

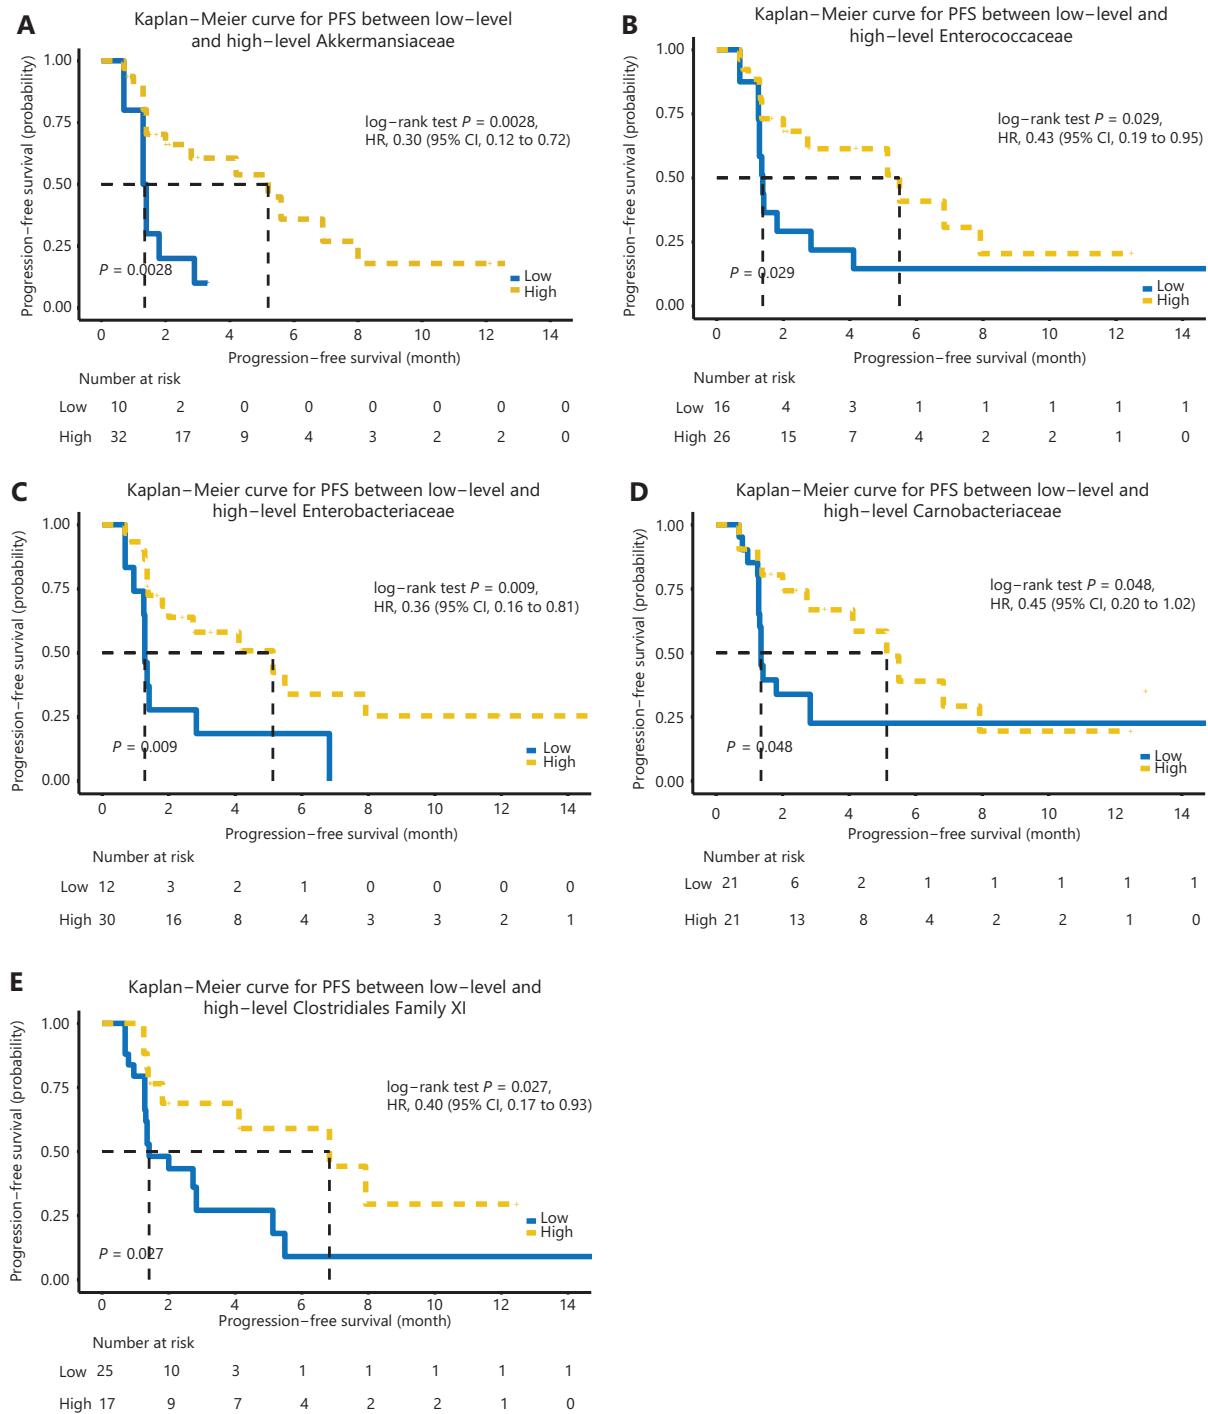

Figure S6 Kaplan-Meier plot of progression-free survival using log-rank tests in patients with high versus low levels of Akkermansiaceae (A), Enterococcaceae (B), Enterobacteriaceae (C), Carnobacteriaceae (D), and Clostridiales Family XI (E).
