

SUPPLEMENTARY FIG. S4. Controls for NF- κ B activity assay. To verify assay specificity and monitor the dynamic range, serial dilutions of a positive control for NF- κ B activation were run in parallel to generate a standard curve. One unit of NF- κ B activity was defined as being equivalent to the response of the undiluted positive control. Also included to verify specificity was a negative control where NF- κ B competitor dsDNA was co-administered in conjunction with the undiluted positive control. NF- κ B, nuclear factor kappa-light-enhancer of activated B-cells.
