

Fig. S6 Increased NICD⁺ cells in the crypts of $\beta 7^{-/-}$ mice.

Representative images (left) and quantification (right) of NICD staining of crypt sections from WT and $\beta 7^{-/-}$ mice. NICD⁺ cells are indicated by yellow arrows. NICD (white), DAPI (blue). Scale bars, 50 μm . $n = 5$ mice per group, more than 8 fields per mouse. Data are represented as mean \pm SEM, *** $P < 0.001$, t -test.
