

S10 Fig. Treg cells are recovered in draining lymph nodes on day 10 with poly IC.

As in Fig 6A, but WT and *Foxp3^{DTR}* mice were injected with DT and S1 on day 0 with or without poly IC. On day 10, draining lymph nodes (axillary and popliteal) were analyzed. Representative graphs from a single experiment (n = 3/group), gated on CD3⁺ CD4⁺ cells (S1B Fig, gating strategy). Data were analyzed using two-way ANOVA with Tukey's multiple comparisons test.
