## 1 **Supplementary Methods**

### 2 **1. Synthesis of amphiphilic polymers of nanoparticles (NP<sub>1</sub>, NP<sub>2</sub>, and NP<sub>3</sub>)**

3 First, anhydrous polyethylene glycol (PEG, 5g) with an average molecular weight of  
4 1000 (Alfa Aesar) and isophorone diisocyanate (1.389 g, 6.25 mmol, IPDI, Sigma) were  
5 added to a dry three-necked, round-bottomed flask. Under nitrogen protection, the  
6 above mixture was first polymerized for 30 min at 60 °C. Then 20 µL catalyst, dibutyltin  
7 dilaurate (DBTDL, 0.034 mmol, Sigma) was added to the above system to react for  
8 another 45 min at 80 °C. After cooling the mixture to room temperature, 50 mL  
9 anhydrous THF (J&K) was then added to dissolve the above polymerized PEG (1) with  
10 terminated NCO groups. Second, dopamine hydrochloride (50 mg, 0.264 mmol, J&K)  
11 in 5 mL anhydrous DMF (J&K) was added, and anhydrous triethylamine (26.7 mg,  
12 0.264 mmol, J&K) was subsequently added to react for 30 min to form the end group-  
13 modified hydrophilic PEG shell (2) of NP<sub>2</sub> nanoparticles. In contrast, β-  
14 phenylethylamine (32 mg, 0.264 mmol, Sigma) was added to the polymerized PEG  
15 with terminated NCO groups (1) to form the end group-modified hydrophilic PEG shell  
16 (3) of NP<sub>3</sub> nanoparticles, while unmodified polymerized PEG with terminated NCO  
17 groups (1) was directly used as the hydrophilic PEG shell of NP<sub>1</sub> nanoparticles. Third,  
18 650 mg hydrophobic segment (4) than can act as the hydrophobic core of nanoparticles  
19 in 10 mL anhydrous DMF was added to react with hydrophilic PEG shell (1, 2, and 3)  
20 for another 1 h to form the final amphiphilic polymers of nanoparticles (NP<sub>1</sub>, NP<sub>2</sub>, and  
21 NP<sub>3</sub>), respectively.

22  
23 Hydrophobic segment (4) that can act as the hydrophobic core of nanoparticles was  
24 synthesized in a simple Ugi four-component reaction, which is a highly efficient and  
25 atom economic reaction under mild conditions for the synthesis of polymeric products<sup>1</sup>-,  
26 <sup>2</sup>. Under nitrogen protection, 3,4-dihydroxybenzaldehyde (7.873g, 57 mmol, J&K) in  
27 25 mL methanol was injected into the solution of 1,6-hexanediamine (3.312 g, 28.5  
28 mmol, TCI) in another 25 mL methanol under magnetic stirring. After 1 hour, tert-butyl  
29 isocyanide (5 g, 60 mmol, J&K) and hexanoic acid (4.165 mg, 28.5 mmol, TCI) were  
30 added to the above system. Then the reaction mixtures were stirred for 96 hours at room  
31 temperature. Precipitation in diethyl ether (1000 mL) yielded the above hydrophobic  
32 segment (5).

### 34 **2. Characterization of nanoparticle-assembled NPA<sub>2</sub> coacervate**

1 The molecular weight distribution of the above polymerized NCO-terminated PEG (1,  
2 1 mg/ml) of which the residual NCO groups had been neutralized by 1 ml anhydrous  
3 methanol (J&K) for 24 h, was determined by GPC (Agilent system, 1260 Infinity II)  
4 with a refractive index detector. Dimethylformamide (DMF, GPC grade) was used as  
5 the elution phase, and polystyrene standards (Agilent, EasiVial PS-M) ranging from  
6 945 to 364000 g/mol were used as the calibration.

7

8 Dynamic light scattering (DLS) results of as-prepared nanoparticles were obtained with  
9 a DelsaMax pro particle sizing & zeta potential instrument. The as-prepared  
10 nanoparticles in transparent solutions (DMF/ deionized water = 3/8, v/v) were diluted  
11 to a concentration of 0.5 wt% by adding a mixture solvent (DMF/ deionized water =  
12 3/8, v/v). Then DLS was performed to detect the hydrodynamic radius of as-prepared  
13 nanoparticles. The diluted NP<sub>2</sub> nanoparticles (0.5 wt%) were further dialyzed against  
14 deionized water (RC dialysis membrane with 3.5 kDa cutoff, Spectrum Chemical) at  
15 room temperature for 3.5 h, and DLS was performed again to confirm the assembly of  
16 NP<sub>2</sub> nanoparticles.

17

18 The formation of NPA<sub>2</sub> coacervate via NP<sub>2</sub> nanoparticle assembly was further verified  
19 by transmission electron microscopy (TEM). NPA<sub>2</sub> coacervate was dropped on the  
20 surface of DI water, floated, and expanded into a thin liquid film. 400-mesh copper  
21 TEM grids (Electron Microscopy Sciences) were used to pick up the thin NPA<sub>2</sub>  
22 coacervate layer and followed by drying under room temperature. Then the prepared  
23 samples were visualized by TEM (Hitachi) operating at 100 kV. Attenuated total  
24 reflectance–Fourier transform infrared (ATR-FTIR, Cary 630, Agilent) spectroscopy  
25 was used to analyze the absorption of freeze-dried NPA<sub>2</sub> coacervate.

26

### 27 **3. Rheological time sweep under various salt concentrations**

28 The rheological time sweeps of the NPA<sub>2</sub> coacervates were performed on a Kinexus  
29 rheometer (Malvern) at room temperature by using a 20 mm 1° cone. For time sweep,  
30 the 1% strain, 1Hz frequency were used. NPA<sub>2</sub> coacervates were first immersed into  
31 NaCl (0.1, 0.5, 1, 2 and 5 M, J&K) and Na<sub>2</sub>SO<sub>4</sub> (0.1, 0.5 and 1M, J&K) aqueous  
32 solutions for 1 hour, respectively. Then time sweeps were performed to evaluate the  
33 changes of G<sup>''</sup>, G<sup>'</sup> and viscosity.

34

#### 4. Lap shear adhesion measurement

Lap-shear tests were performed according to the previous report on a Kinexus rheometer (Malvern) equipped with a 20 N load cell (100 mm min<sup>-1</sup>)<sup>3</sup>. Fresh porcine skins and porcine intestine were bought from Sha Tin Market (Hong Kong), and washed with PBS buffer (1×, Gibco) three times before use. The NPA<sub>2</sub> and NPA<sub>3</sub> coacervates or single-phase solutions of NP<sub>1</sub> were spread over the interface between two ribbons of skin tissue or porcine intestine luminal surfaces before lap-shear tests, respectively. Then the lap-shear tests were conducted immediately. Reversible bonding/debonding cycles of NPA<sub>2</sub> coacervate were performed by directly re-sticking two ribbons of porcine tissue together for the next lap-shear test without a pause. Adhesion energy,  $G_{ad}$ , was calculated using the following equation<sup>4</sup>:

$$G_{ad} = 3(F/w)^2/(2Eh)$$

$F$  is the measured adhesive failure force.  $w$  and  $h$  denote, respectively, the width and thickness of the pork skin ribbon.  $E$  is the tensile modulus of pork skin ( $w = 5$  mm,  $h = 3.5$  mm). We have calculated the  $E$  values by performing the tensile stress-strain curve of the porcine skin (~0.53 MPa) and the porcine intestine (~0.705 MPa), respectively (Supplementary Figure 11 and 12).

#### 5. Cyclic voltammetry (CV) measurement of NPA<sub>2</sub> coacervate

CV was performed on a VMP3 electrochemical testing unit (Bio-Logic)<sup>5</sup>. The analysis was carried out using a three-electrode cell: a Pt wire as the counter electrode, an Ag/AgCl reference electrode, and a glassy carbon electrode (GCE) served as the working electrode. Scan rate 0.05 V s<sup>-1</sup> was used. Measurements were done with 0.01 wt% NPA<sub>2</sub> coacervates in deionized water.

#### 6. Histological analysis

Tissues were first fixed in PBS buffer (1×) with 4% paraformaldehyde (J&K). Then tissue sections of the distal colon embedded in paraffin were stained using haematoxylin and eosin (H&E, Sigma). Furthermore, histopathology scoring of H&E-stained tissue sections was used to evaluate the severity of colonic histological damage in a blinded fashion by a trained pathologist<sup>6</sup>. Briefly, DSS-induced colonic damage was scored as follows: 0, Normal; 1, slight increase in cellularity; 2, increased cellularity including neutrophils, mild edema; 3, focal erosions, ulcerations of the

1 mucosa; 4, large and or multifocal mucosal ulcerations; 5, Loss of mucosal architecture.

2

### 3 **7. MPO activity measurement**<sup>7</sup>

4 A colon segment (1:20, w/v) in 50 mM phosphate buffer (pH 6.0) containing 0.5%  
5 hexadecyltrimethyl ammonium bromide was homogenized on ice using plastic  
6 homogenization pestles. After sonicating for 15 s, the homogenate was centrifuged at  
7 19721 x g (Centrifuge 5424 R, Eppendorf) for 15 min. The supernatant (10  $\mu$ l) was  
8 added to 190  $\mu$ l of 50 mM phosphate buffer (pH 6) containing 0.167 mg/ml O-  
9 dianisidine dihydrochloride and 0.0005% hydrogen peroxide<sup>8</sup>. The changes in  
10 absorbance at 460 nm (25 °C) were measured every 5 minutes. MPO activity was  
11 expressed as changes of OD values every minutes per mg of protein. The overall protein  
12 content was measured by Pierce BCA Protein Assay Kit (Thermo Fisher Scientific).

13

### 14 **8. Real time RT-PCR**

15 RNA was extracted from colonic tissues using TRIzol (Thermo Fisher). The RNA  
16 concentration was then determined by the ND-100 spectrophotometer (Nanodrop  
17 Technologies). Reverse transcription was performed by PrimeScript RT Master Mix  
18 (Takara Bio). Quantitative reverse transcription polymerase chain reaction (qRT-PCR)  
19 was performed using the SYBR Green method (Takara Bio) on Applied Biosystems  
20 7300 Real-Time PCR system. The gene expression levels were normalized to those of  
21 GAPDH by the  $\Delta\Delta$ CT relative method. The customized qPCR Primers were bought  
22 from GenScript (China). The following primer sets were used for amplifications:

qPCR Primer		
Gene	Forward (5'→3')	Reverse (5'→3')
ZO-1	GCAAGGGATAGAAGCGCAAG	TATGGCTGGCCAATCGAAGAC
Occludin-1	TAGCCATTGTCCTGGGGTTC	CGGTCCATCTTCTTCGGGT
IL-1 $\beta$	CAGGATGAGGACCCAAGCAC	CAGGTCGTCATCATCCACG
TNF	GACCCTCACACTCAGATCATCTTCT	TCCGCTTGGTTTGCTA
IL-10	CCTGGTAGAAGTGATGCCCC	TGTCACGTAGGCTTCTATGCAG
IL-6	CTGGTCTTCTGGAGTTCGGT	GGTCCTTAGCCACTCCTTCTG
GAPDH	CTGTTCTAGAGACAGCCGCATCT	ACACCGACCTTCACCATCTTG

23

24

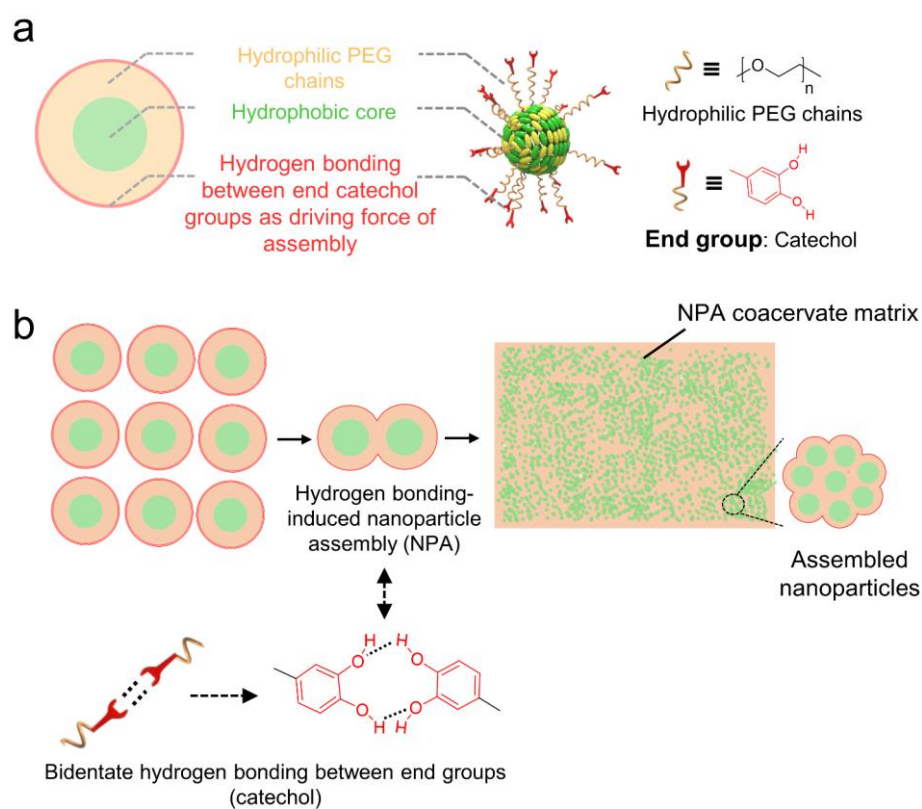

### 25 **9. Gut microbiota analysis**

26 The fresh fecal samples in autoclaved sterile vials were properly packaged with dry ice  
27 cooling agents and shipped to BGI Genomics Co., Ltd (Hong Kong) for microbiota

1 analyses by sequencing the V4 region of the 16S ribosomal ribonucleic acid (rRNA)  
2 gene. Briefly, genomic DNA was extracted and used to generate 16S rRNA libraries  
3 using the Illumina MiSeq platform. After eliminating the adapter pollution and low  
4 quality within raw sequences, paired-end reads with overlap were merged to tags  
5 (minimal overlapping length: 15 bp; mismatching ratio of overlapped region:  $\leq 0.1$ ).  
6 Next tags were clustered to OTUs (Operational Taxonomic Units) by scripts of software  
7 USEARCH (v7.0.1090) with a 97% threshold. Taxonomic ranks were assigned to OTU  
8 representative sequence using Ribosomal Database Project (RDP) Naïve Bayesian  
9 Classifier v.2.2. At last, alpha diversity (Mothur, v1.31.2), beta diversity (QIIME, v1.80)  
10 and the different species screening were analyzed based on OTU and taxonomic ranks.  
11 Species clustering heat map was fabricated using the package 'gplots' of software R  
12 (v3.1.1). The distance algorithm is 'euclidean', and the clustering method is 'complete'.

14  
 15 **Supplementary Figure 26.** a) Drug-laden NPA<sub>2</sub> coacervate can be encapsulated into  
 16 the enteric capsules, thus potentially combining both the advantages of sustained  
 17 release and targeting of the desired region. b) Treatment with Dex-P/PBS via enema on  
 18 days 1, 3, and 5 decreased the colonic MPO activity in colitic SD rats at day 7 to a  
 19 similar level as that of the oral delivery of Dex-P/NPA<sub>2</sub>. n = 3 biologically independent  
 20 rats in Enema of Dex-P/PBS group, n = 6 biologically independent rats in Dex-P/NPA<sub>2</sub>  
 21 group. Data are presented as mean ± SD. (N.S.) P > 0.05, \*P < 0.05, \*\*P < 0.01, \*\*\*P  
 22 < 0.001 (two-tailed Student's t-test).

2

3 **Supplementary Figure 27.** Quantification of macrophages positive of M1 (iNOS) and  
 4 M2 (CD206) markers indicates that oral administration of Dex-P/NPA<sub>2</sub> to colitic SD  
 5 rats promoted anti-inflammatory M2 macrophage polarization (CD206) and suppressed  
 6 pro-inflammatory M1 polarization (iNOS). n = 3 randomly selected  
 7 immunohistochemical images from 5 biologically independent rats per group. Data are  
 8 presented as mean ± SD. \*P<0.05, \*\*P<0.01, \*\*\*P<0.001 (Ordinary one-way ANOVA).
