N: Number of sample size; OR: Odds ratio; HR: hazard ratios;

Adjusted: Models were adjusted for premature or full-term delivery and breastfeeding status.

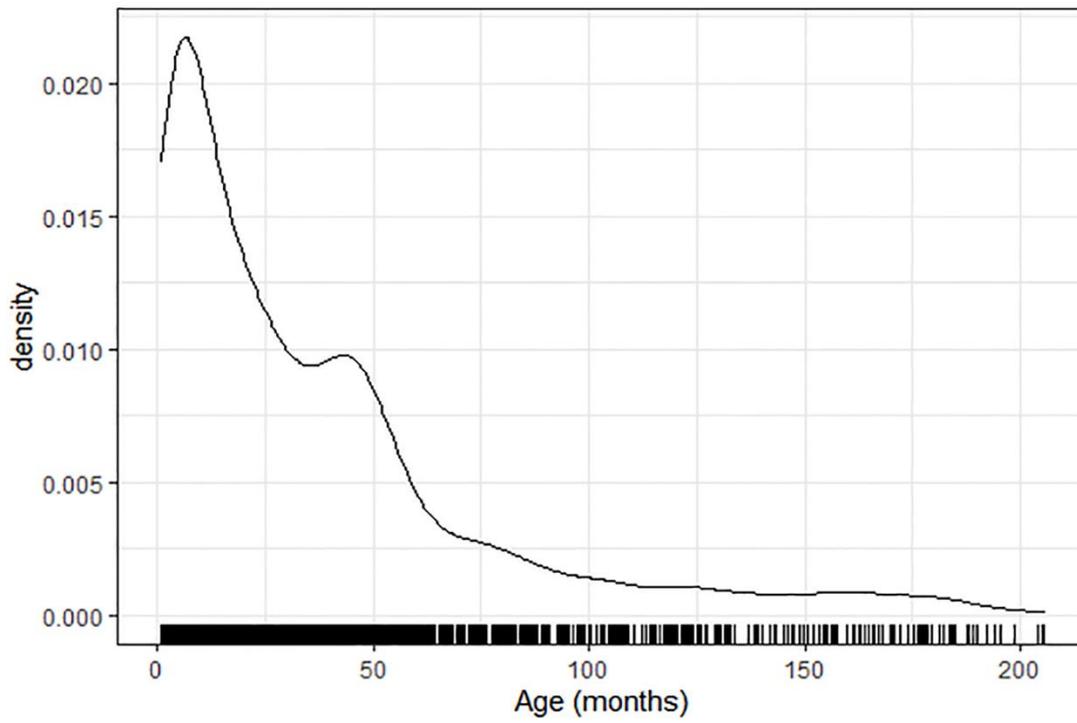

Figure S1: the distribution of age of all children.

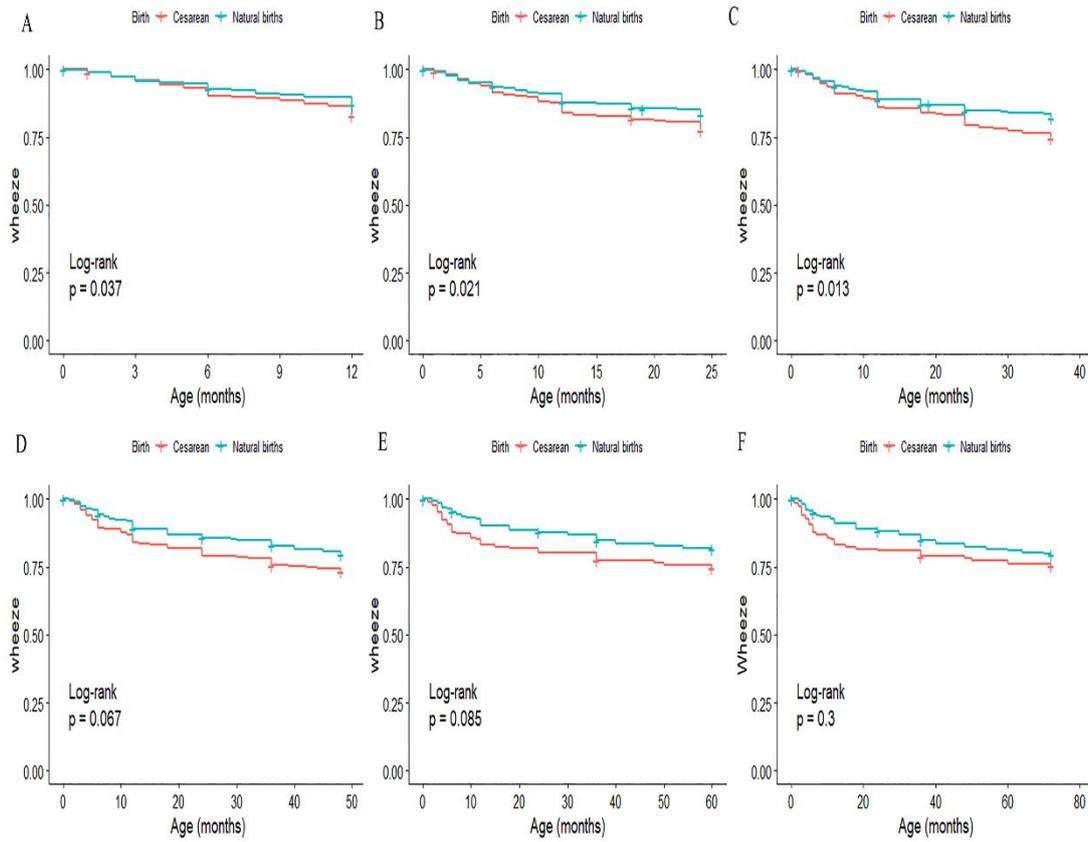

Figure S2: The effects on the development of FEW was assessed by Kaplan–Meier curves and quantified by means of Cox proportional hazards regression (P values correspond to Wald tests). A: in first 1 year; B: in first 2 year; C: in first 3 year; D: in first 4 year; E: in first 5 year; F in first 6 year.

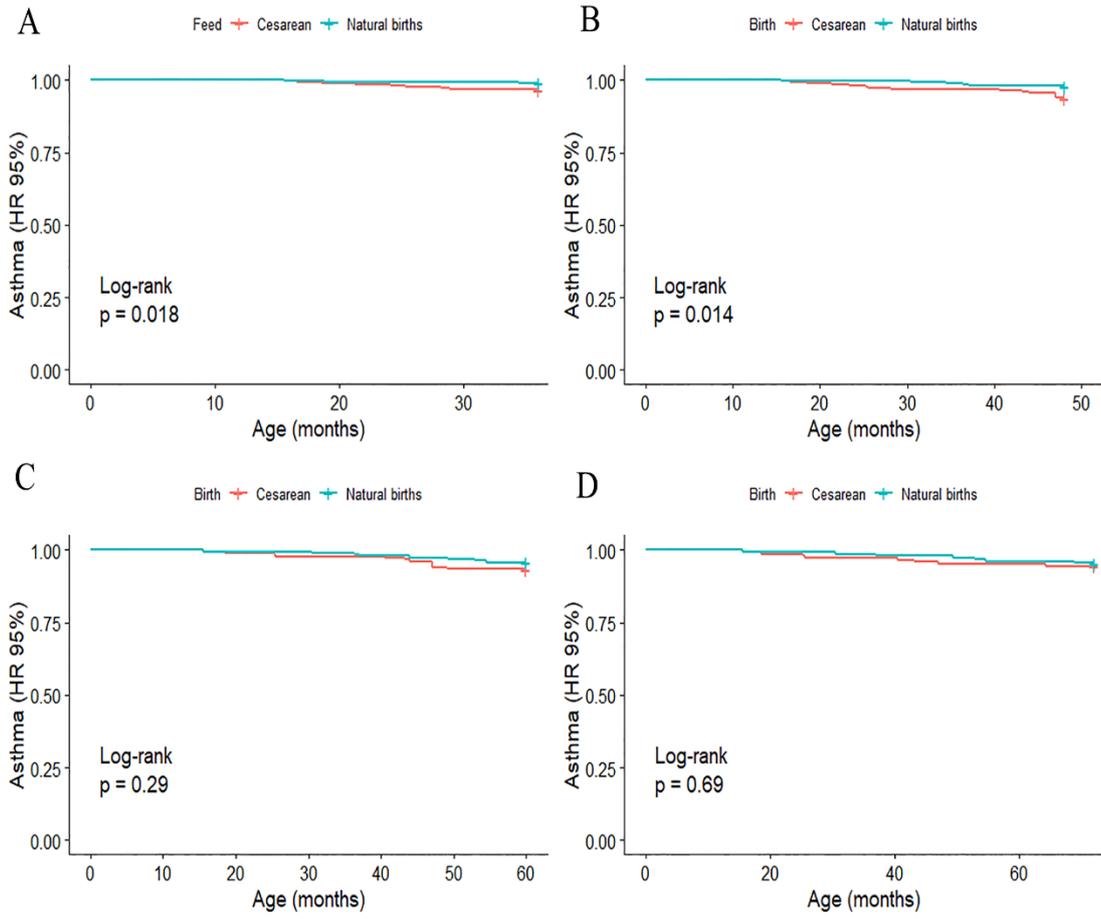

Figure S3: The effects on the development of asthma was assessed by Kaplan–Meier curves and quantified by means of Cox proportional hazards regression (P values correspond to Wald tests). A: in first 3 year; B: in first 4 year; C: in first 5 year; D: in first 6 year.

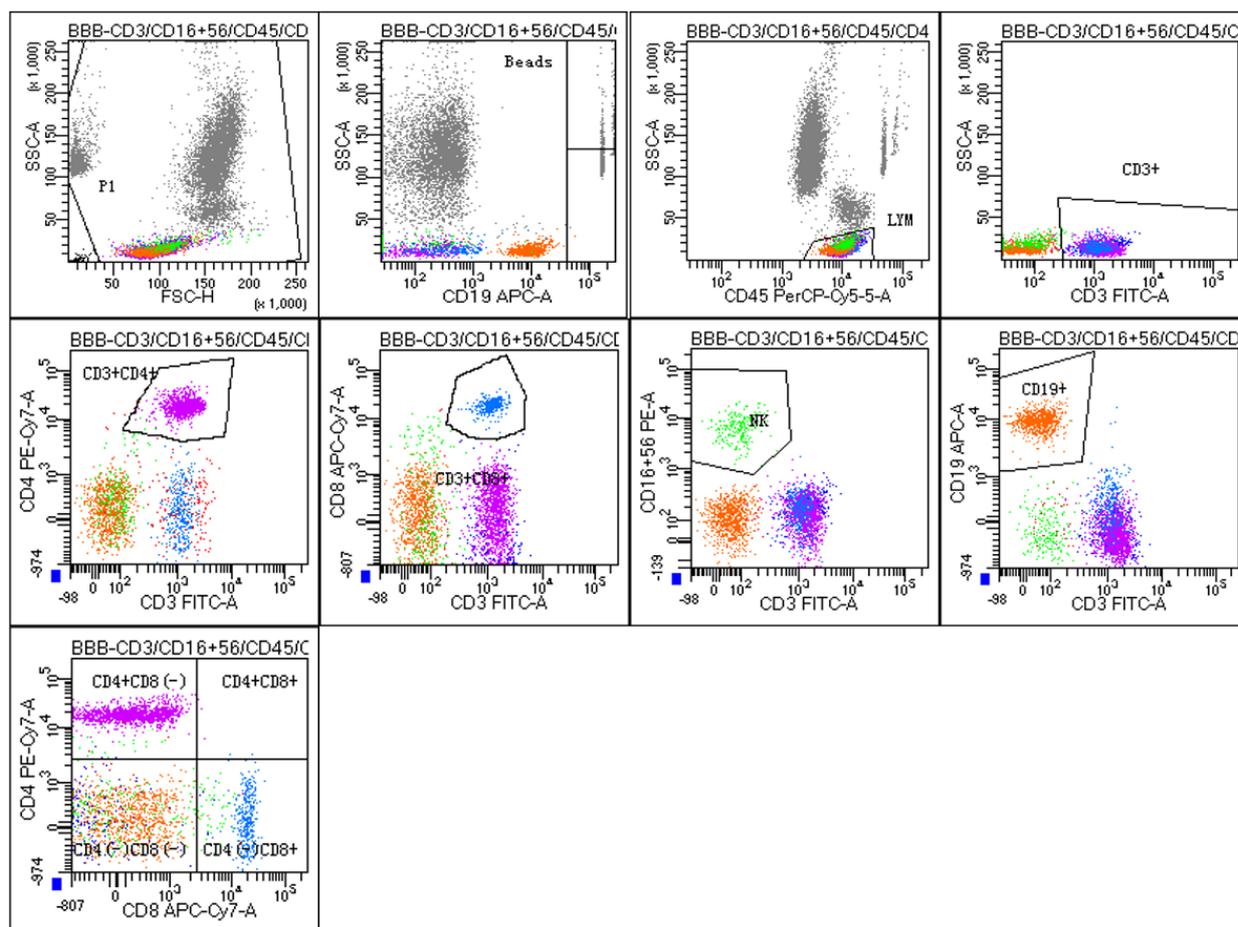

Figure S4: The flow cytometry of immune cells in children. BD Multitest™ 6-color TBNK reagent (<https://www.bdbiosciences.com/zh-cn>) was used for flow cytometry (FC) of TBNK (T cells, B cells and NK cells, cells/ μ l). It contains FITC-labeled CD3, clone SK7; PE-labeled CD16, clone B73.1, and CD56, clone NCAM16.2; PerCP-Cy™5.5†-labeled CD45, clone 2D1 (HLe-1); PE-Cy™7-labeled CD4, clone SK3; APC-labeled CD19, clone SJ25C1; and APC-Cy7‡-labeled CD8, clone SK1. The absolute number (cells/ μ L) of positive cells in the sample can be determined by comparing cellular events to bead events. Absolute counts of cells are calculated by BD FACSCanto clinical software using the following formula: cell population absolute count test volume = (events in cell population/events in absolute count bead region)*(beads of each test/ test volume).
