

eFigure 1.

Sensitivity analysis for the estimation of the conversion equation for predicting central subfield thickness (CST) values on a Spectralis machine from CST observed on a Cirrus machine included estimating the conversion equation from the training sample subset (70% of the full sample) when (1) two levels of random effects (participant and eye) were specified and when (2) gender and gender machine interaction terms were included in the regression equation, and one level of random effects (eye) were specified.
