

Supplemental Figure 1. Marked cells show characteristics of transitional radial glia. (A) Brightfield immunostaining for RFP in the cortex of a mouse at P3 after receiving tamoxifen at P0 showing many cells with transitional morphologies and the appearance of residual radial glial fibers. Scale bar, 25 μm **(B-F)** Colocalization of tdTom (C, red), vimentin (D, green), and BrdU (E, gray) in the cortex of *Gli1^{Cre}ER/+;Ai14* mice at P3 after tamoxifen at P0. Merged image in (B), single channel images in C-F.
