

Suppl fig 5. Addition of a GFP tag does not affect SFTPC endocytosis. Quantitative SFTPC internalisation assay. Cells expressing untagged SFTPC-WT, I73T or K6R were labelled with BRICHOS domain antibody on ice, then protein allowed to internalise at 37°C for the indicated times. Cells were placed back on ice, fixed but not permeabilised, and labelled with a secondary antibody before analysis by flow cytometry. n=3, mean +/- sem.
