

Supplementary Appendix

Supplement to: Atmar RL, Lyke KE, Deming ME, et al. Homologous and heterologous Covid-19 booster vaccinations. *N Engl J Med*. DOI: 10.1056/NEJMoa2116414

This appendix has been provided by the authors to give readers additional information about the work.

Supplementary Appendix to Manuscript Entitled

Heterologous SARS-CoV-2 Booster Vaccinations – Preliminary Report

Table of Contents

Mix and Match Study Group	6
Mix and Match Study Team Members	8
Supplemental Methods	12
Binding Assay Method Description	12
10-plex ECLIA	12
4-plex ECLIA V.2	12
Reporting:	13
Pseudovirus Neutralization Immunogenicity Method Description	14
T Cell Intracellular Cytokine Staining Assay Method Description.....	17
Random Effects Model - Analysis of Serologic Endpoints at the Site Level.....	18

Supplemental Tables

Supplemental Table 1. Characteristics of mRNA-1273 boosted participants, by age.	19
Supplemental Table 2. Characteristics of Ad26.COVS boosted participants, by age.	21
Supplemental Table 3. Characteristics of BNT162b2 boosted participants, by age.....	23
Supplemental Table 4. Unsolicited AEs in Stage 1 (mRNA-1273).....	25
Supplemental Table 5. Unsolicited AEs in Stage 2 (Ad26.COVS).....	28
Supplemental Table 6. Unsolicited AEs in Stage 3 (BNT162b2).....	31
Supplemental Table 7. Local Adverse Events in Stage 1 (mRNA-1273) by Age and Group.....	34
Supplemental Table 8. Local Adverse Events in Stage 2 (Ad26.COVS) by Age and Group.....	35
Supplemental Table 9. Local Adverse Events in Stage 3 (BNT162b2) by Age and Group.....	36
Supplemental Table 10. Systemic Solicited Events Stage 1 (mRNA-1273).....	37
Supplemental Table 11. Systemic Solicited Events Stage 2 (Ad26.COVS).....	38
Supplemental Table 12. Systemic Solicited Events Stage 3 (BNT162b2).....	40

Serum Binding Antibodies

Supplemental Table 13. mRNA-1273 IgG Binding Antibody to S-2P-WA-1 - 4-plex (binding ab units- BAU).....	42
Supplemental Table 14. mRNA-1273 IgG Binding Antibody to S-2P-WA-1 - 4-plex by Age Group (BAU).....	43
Supplemental Table 15. Ad26.COVS IgG Binding Antibody to S-2P-WA-1 - 4-plex (BAU).....	44
Supplemental Table 16. Ad26.COVS IgG Binding Antibody to S-2P-WA-1 - 4-plex by Age Group (BAU).....	45
Supplemental Table 17. BNT162b2 IgG Binding Antibody to S-2P-WA-1 - 4-plex (BAU).....	46
Supplemental Table 18. BNT162b2 IgG Binding Antibody to S-2P-WA-1 - 4-plex by Age Group (BAU).....	47
Supplemental Table 19. mRNA-1273 IgG Binding Antibody to S-2P-WA-1 - 4-plex (arbitrary units - au).....	48
Supplemental Table 20. mRNA-1273 IgG Binding Antibody to S-2P-WA-1 - 4-plex by Age Group (au).....	49
Supplemental Table 21. Ad26.COVS IgG Binding Antibody to S-2P-WA-1 - 4-plex (au).....	49
Supplemental Table 22. Ad26.COVS IgG Binding Antibody to S-2P-WA-1 - 4-plex by Age (au).....	51

Supplemental Table 23. BNT162b2 IgG Binding Antibody to S-2P-WA-1 - 4-plex (au)	52
Supplemental Table 24. BNT162b2 IgG Binding Antibody to S-2P-WA-1 4-plex by Age (au).....	53
Supplemental Table 25. mRNA-1273 IgG Binding Antibody to S-2P-WA-1 (control) - 10-plex	53
Supplemental Table 26. mRNA-1273 IgG Binding Antibody to S-2P-WA-1 (control) - 10-plex by Age Group	55
Supplemental Table 27. Ad26.COV2.S IgG Binding Antibody to S-2P-WA-1 (control) - 10-plex	56
Supplemental Table 28. Ad26.COV2.S IgG Binding Antibody to S-2P-WA-1 (control) - 10-plex by Age Group.....	57
Supplemental Table 29. BNT162b2 IgG Binding Antibody to S-2P-WA-1 (control) - 10-plex.....	58
Supplemental Table 30. BNT162b2 IgG Binding Antibody to S-2P-WA-1 (control) - 10-plex by Age Group	59
Supplemental Table 31. mRNA-1273 IgG Binding Antibody to S-2P-B.1.617.2 - 10-plex.....	61
Supplemental Table 32. mRNA-1273 IgG Binding Antibody to S-2P-B.1.617.2 - 10-plex by Age Group	62
Supplemental Table 33. Ad26.COV2.S IgG Binding Antibody to S-2P-B.1.617.2 - 10-plex	63
Supplemental Table 34. Ad26.COV2.S IgG Binding Antibody to S-2P-B.1.617.2 - 10-plex by Age Group	64
Supplemental Table 35. BNT162b2 IgG Binding Antibody to S-2P-B.1.617.2 - 10-plex.....	65
Supplemental Table 36. BNT162b2 IgG Binding Antibody to S-2P-B.1.617.2 - 10-plex by Age Group.....	66
Supplemental Table 37. mRNA-1273 IgG Binding Antibody to S-2P-B.351 - 4-plex	68
Supplemental Table 38. mRNA-1273 IgG Binding Antibody to S-2P- B.351 - 4-plex by Age Group	69
Supplemental Table 39. Ad26.COV2.S IgG Binding Antibody to S-2P-B.351 - 4-plex	71
Supplemental Table 40. Ad26.COV2.S IgG Binding Antibody to S-2P-B.351 - 4-plex by Age Group	72
Supplemental Table 41. BNT162b2 IgG Binding Antibody to S-2P-B.351 - 4-plex.....	74
Supplemental Table 42. BNT162b2 IgG Binding Antibody to S-2P-B.351 - 4-plex by Age Group.....	75

Serum Pseudovirion Neutralization Antibodies

Supplemental Table 43. mRNA-1273 Pseudovirion Neutralization Antibody (IU50) to D614G	77
Supplemental Table 44. mRNA-1273 Pseudovirion Neutralization Antibody (IU50) to D614G by Age	78
Supplemental Table 45. Ad26.COV2.S Pseudovirion Neutralization Antibody (IU50) to D614G	79
Supplemental Table 46. Ad26.COV2.S Pseudovirion Neutralization Antibody (IU50) to D614G by Age	80
Supplemental Table 47. BNT162b2 Pseudovirion Neutralization Antibody(IU50) to D614G.....	81
Supplemental Table 48. BNT162b2 Pseudovirion Neutralization Antibody (IU50) to D614G by Age.....	82
Supplemental Table 49. mRNA-1273 Pseudovirion Neutralization Antibody (IU80) to D614G	83
Supplemental Table 50. mRNA-1273 Pseudovirion Neutralization Antibody (IU80) to D614G by Age	84
Supplemental Table 51. Ad26.COV2.S Pseudovirion Neutralization Antibody (IU80/ to D614G.....	85
Supplemental Table 52. Ad26.COV2.S Pseudovirion Neutralization Antibody (IU80) to D614G by Age.....	86
Supplemental Table 53. BNT162b2 Pseudovirion Neutralization Antibody (IU80) to D614G.....	87
Supplemental Table 54. BNT162b2 Pseudovirion Neutralization Antibody (IU80) to D614G by Age.....	88
Supplemental Table 55. mRNA-1273 Pseudovirion Neutralization Antibody (ID50) to D614G	89
Supplemental Table 56. mRNA-1273 Pseudovirion Neutralization Antibody (ID50) to D614G by Age	90
Supplemental Table 57. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID50) to D614G	92
Supplemental Table 58. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID50) to D614G by Age	93
Supplemental Table 59. BNT162b2 Pseudovirion Neutralization Antibody (ID50) to D614G.....	95
Supplemental Table 60. BNT162b2 Pseudovirion Neutralization Antibody (ID50) to D614G by Age.....	96
Supplemental Table 61. mRNA-1273 Pseudovirion Neutralization Antibody (ID80) to D614G	98
Supplemental Table 62. mRNA-1273 Pseudovirion Neutralization Antibody (ID80) to D614G by Age	99

Supplemental Table 63. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID80) to D614G	101
Supplemental Table 64. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID80) to D614G by Age	102
Supplemental Table 65. BNT162b2 Pseudovirion Neutralization Antibody (ID80) to D614G	104
Supplemental Table 66. BNT162b2 Pseudovirion Neutralization Antibody (ID80) to D614G by Age	105
Supplemental Table 67. mRNA-1273 Pseudovirion Neutralization Antibody (ID50) to B.1.617.2	107
Supplemental Table 68. mRNA-1273 Pseudovirion Neutralization Antibody (ID50) to B.1.617.2 by Age	108
Supplemental Table 69. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID50) to B.1.617.2	110
Supplemental Table 70. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID50) to B.1.617.2 by Age	111
Supplemental Table 71. BNT162b2 Pseudovirion Neutralization Antibody (ID50) to B.1.617.2	112
Supplemental Table 72. BNT162b2 Pseudovirion Neutralization Antibody (ID50) to B.1.617.2 by Age	113
Supplemental Table 73. mRNA-1273 Pseudovirion Neutralization Antibody (ID80) to B.1.617.2	114
Supplemental Table 74. mRNA-1273 Pseudovirion Neutralization Antibody (ID80) to B.1.617.2 by Age	115
Supplemental Table 75. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID80) to B.1.617.2	117
Supplemental Table 76. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID80) to B.1.617.2 by Age	118
Supplemental Table 77. BNT162b2 Pseudovirion Neutralization Antibody (ID80) to B.1.617.2	119
Supplemental Table 78. BNT162b2 Pseudovirion Neutralization Antibody (ID80) to B.1.617.2 by Age	120
Supplemental Table 79. mRNA-1273 Pseudovirion Neutralization Antibody (ID50) to B.1.351	122
Supplemental Table 80. mRNA-1273 Pseudovirion Neutralization Antibody (ID50) to B.1.351 by Age	123
Supplemental Table 81. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID50) to B.1.351	125
Supplemental Table 82. Ad26.COV2.S Pseudovirion Neutralization Antibodies (ID50) to B.1.351 by Age	126
Supplemental Table 83. BNT162b2 Pseudovirion Neutralization Antibody (ID50) to B.1.351	127
Supplemental Table 84. BNT162b2 Pseudovirion Neutralization Antibody (ID50) to B.1.351 by Age	128
Supplemental Table 85. mRNA-1273 Pseudovirion Neutralization Antibody (ID80) to B.1.351	129
Supplemental Table 86. mRNA-1273 Pseudovirion Neutralization Antibody (ID80) to B.1.351 by Age	130
Supplemental Table 87. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID80) to B.1.351	131
Supplemental Table 88. Ad26.COV2.S Pseudovirion Neutralization Antibody (ID80) to B.1.351 by Age	132
Supplemental Table 89. BNT162b2 Pseudovirion Neutralization Antibody (ID80) to B.1.351	133
Supplemental Table 90. BNT162b2 Pseudovirion Neutralization Antibody (ID80) to B.1.351 by Age	134

T cell Immunologic Assays

Supplemental Table 91. mRNA-1273 CD4 T cell Th1 Cytokine Expression to Spike Peptide Pool	135
Supplemental Table 92. mRNA-1273 CD4 T cell Th1 Cytokine Expression to Spike Peptide Pool by Age	136
Supplemental Table 93. mRNA-1273 CD4 T cell Th2 Cytokine Expression to Spike Peptide Pool	137
Supplemental Table 94. mRNA-1273 CD4 T cell Th2 Cytokine Expression to Spike Peptide Pool by Age	138
Supplemental Table 95. mRNA-1273 CD8 T cell Th1 Cytokine Expression to Spike Peptide Pool	139
Supplemental Table 96. mRNA-1273 CD8 T cell Th1 Cytokine Expression to Spike Peptide Pool by Age	140
Supplemental Table 97. Ad26.COV2.S CD4 T cell Th1 Cytokine Expression to Spike Peptide Pool	141
Supplemental Table 98. Ad26.COV2.S CD4 T cell Th1 Cytokine Expression to Spike Peptide Pool by Age	142
Supplemental Table 99. Ad26.COV2.S CD4 T cell Th2 Cytokine Expression to Spike Peptide Pool	143
Supplemental Table 100. Ad26.COV2.S CD4 T cell Th2 Cytokine Expression to Spike Peptide Pool by Age	144
Supplemental Table 101. Ad26.COV2.S CD8 T cell Th1 Cytokine Expression to Spike Peptide Pool	145
Supplemental Table 102. Ad26.COV2.S CD8 T cell Th1 Cytokine Expression to Spike Peptide Pool by Age	146

Supplemental Table 103. BNT162b2 CD4 T cell Th1 Cytokine Expression to Spike Peptide Pool	147
Supplemental Table 104. BNT162b2 CD4 T cell Th1 Cytokine Expression to Spike Peptide Pool by Age	148
Supplemental Table 105. BNT162b2 CD4 T cell Th2 Cytokine Expression to Spike Peptide Pool	149
Supplemental Table 106. BNT162b2 CD4 T cell Th2 Cytokine Expression to Spike Peptide Pool by Age	150
Supplemental Table 107. BNT162b2 CD8 T cell Th1 Cytokine Expression to Spike Peptide Pool	151
Supplemental Table 108. BNT162b2 CD8 T cell Th1 Cytokine Expression to Spike Peptide Pool by Age	152

Participating Sites

Supplemental Table 109. Numbers of participants enrolled by study site and study group	153
--	-----

Supplemental Figures

Supplemental Figure 1: Consort Diagram for Stage 1 (Groups 1-3).....	154
Supplemental Figure 2: Consort Diagram for Stage 2 (Groups 4-6).....	155
Supplemental Figure 3: Consort Diagram for Stage 3 (Groups 7-9).....	156

Mix and Match Study Group

(listed in PubMed and ordered by lead institutions and enrollment)

Baylor College of Medicine (BCM), Houston TX, Vaccine Training and Evaluation Unit (VTEU)

Robert L. Atmar, M.D., Hana El Sahly, M.D., Jennifer A. Whitaker, M.D., and Wendy A. Keitel, M.D.

University of Maryland, Institute of Human Virology and Center for Vaccine Development and Global Health, Baltimore, MD, VTEU

Kirsten E. Lyke, M.D., Meagan Deming, M.D., Ph.D., Jennifer S. Husson, M.D., M.P.H., Angie Price, D.N.P., M.S.N., C.R.N.P.

Kaiser Permanente Washington Health Research Institute, Seattle, Washington, VTEU

Lisa A. Jackson, MD, MPH

University of Rochester Medical Center, Rochester, NY, VTEU

Angela Branche, M.D., David Dobryzynski, M.D., Ann R. Falsey, M.D., Ian Shannon, MS, RN,

The Hope Clinic of Emory University (Hope), Atlanta, GA, VTEU

Srilatha Edupuganti, M.D., M.P.H., Paulina A. Rebolledo, M.D., M.Sc., Nadine Rouphael, M.D., M.Sc.

Emory Children's Center (ECC), Atlanta, GA, VTEU

Christina Rostad, M.D., Andres F. Camacho-Gonzalez, M.D., M.Sc., Satoshi Kamidani, M.D.

University of Pittsburgh School of Medicine, Pittsburgh, PA, subsidiary to Vanderbilt University VTEU, Nashville, TN

Judith Martin, M.D., Kumaravel Rajakumar, M.D., M.S., Gysella B. Muniz M.D., Sonika Bhatnagar, M.D., M.P.H.

University of Washington, Seattle, WA, VTEU

Christine Johnston, M.D., M.P.H., Tara M. Babu, M.D., M.SCI., Anna Wald, M.D., M.P.H.

University of Texas Medical Branch (UTMB), League City, TX, subsidiary to BCM VTEU

Richard E. Rupp, M.D., Megan Berman, M.D., Laura Porterfield, M.D., Amber Stanford, PA-C

New York University – Bellevue Vaccine Center, New York, NY, VTEU

Mark J. Mulligan, M.D., FIDSA, Angelica Cifuentes Kottkamp, M.D., Jennifer Lee Dong, M.D.

New York University- Long Island Vaccine Center, Mineola, NY, subsidiary to NYU VTEU

Martín Bäcker, MD, Steven E. Carsons, MD, Diana Badillo, MD,

Cincinnati Children's Hospital Medical Center (CCHMC), Cincinnati, OH, VTEU

Rebecca Brady, M.D., Robert W. Frenck, Jr., M.D., Susan Parker, R.N., Michelle Dickey, A.P.R.N.

Seattle Children’s Research Institute, Seattle, WA

Rhea N. Coler, M.Sc., Ph.D., Sasha E. Larsen, Ph.D.

Infectious Diseases Clinical Research Consortium (IDCRC) Laboratory Operations Unit (LOU)

Christine M. Posavad, Ph.D., John Hural, Ph.D

IDCRC Leadership

Kathleen M. Neuzil, M.D., David Stephens, M.D.

IDCRC Statistical and Data Science Unit (SDSU):

Elizabeth R. Brown, Sc.D., Clara Dominguez Islas, Ph.D.

Statistical Center for HIV/AIDS Research and Prevention (SCHARP), Seattle, WA:

Jillian Zemanek, M.P.H., Daniel Szydlo, M.S., Rahul Paul Choudhury, MS,

Division of Microbiology and Infectious Diseases (DMID), National Institute of Allergy and Infectious Diseases (NIAID), National Institutes of Health (NIH), Bethesda, MD.

Sonja Crandon, B.S.N., Marina Lee, Ph.D., Seema Nayak, M.D., Paul C Roberts, Ph.D., John Beigel, M.D.

FHI360, Durham, NC

Janet I. Archer M.Sc.

NIH Laboratory - Vaccine Research Center, Vaccine Immunology Program (VRC-VIP)

Adrian McDermott, Ph.D., Sarah O’Connell, M.S., Bob Lin

Duke University Laboratory – Durham, NC

David Montefiori, Ph.D., Amanda Eaton, Ph.D.

Emory University Laboratory (FRNT), Atlanta, GA

Mehul S. Suthar, Ph.D., Lilin Lai, MD

Fred Hutch Seattle, WA (ICS)

M. Juliana McElrath, MD, PhD, Kristen W. Cohen, PhD, Stephen De Rosa, MD

Supplemental Methods

Binding Assay Method Description

10-plex ECLIA

Testing for serum IgG binding to variants of concern was performed using a fit-for-purpose 10-plex MSD method.¹ Multiplexed Plates (96 well) precoated with up to ten antigens per panel are supplied by the manufacturer. On the day of the assay, the plate is blocked for 60 minutes with MSD Blocker A (5% BSA). The blocking solution is washed off and test samples are applied to the wells at 4 dilution (1:100, 1:500, 1:2500 and 1:10,000) unless otherwise specified and allowed to incubate with shaking for two hours. Plates are washed and Sulfo-tag labeled anti IgG antibody is applied to the wells and allowed to associate with complexed coated antigen – sample antibody within the assay wells. Plates are washed to remove unbound detection antibody. A read solution containing ECL substrate is applied to the wells, and the plate is entered into the MSD Sector instrument. A current is applied to the plate and areas of well surface where sample antibody has complexed with coated antigen and labeled reporter will emit light in the presence of the ECL substrate. The MSD Sector instrument quantitates the amount of light emitted and reports this ECL unit response as a result for each sample and standard of the plate. Magnitude of ECL response is directly proportional to the extent of binding antibody in the test article. All calculations are performed within Excel and the GraphPad Prism software, version 7.0. Readouts are provided as Area Under Curve (AUC).

4-plex ECLIA V.2

Testing was performed using the automated 4 plex MSD method. Quantification of IgG concentrations in serum/plasma were performed with a Beckman Biomek based automation platform. This variant 4plex is in the final stages of validation of the S-2P-B.1.351 and confirmation of validation of the S-2P-WA-1, all performed in alignment with the previously validated SARS-CoV-2 3plex as well as the FDA provided guidance on variant validation.

Briefly, MSD SECTOR[®] plates are precoated by MSD with Wa-1 SARS-CoV-2 spike (S-2P), B.1.351 receptor binding domain (RBD) protein, Nucleocapsid (N) protein and B.1.351 spike protein in each well in a specific spot-designation for each antigen. The assay will be performed with a Beckman Coulter Biomek based automation integration platform including the Biotek 405TS Plate Washer. Serum samples will be heat-inactivated for 30 minutes at 56°C prior to assay. Plates are blocked for 60 minutes at room temperature (RT) with MSD blocker A solution without shaking. Plates are washed and MSD reference standard (calibrator), QC test sample (pool of COVID-19 convalescent sera) and human serum test samples are added to the precoated wells in duplicates in an 8-point dilution series. Reference standard is added in triplicates. MSD Control sera (low, medium and high) are added undiluted in triplicates as per validated assay format. Additional assay controls might be added in triplicates. Samples are incubated at RT for 4 hours with shaking on a Titramax Plate shaker (Heidolph) at 1500 rpm. SARS-CoV-2 specific antibodies present in the sera or controls bind to the coated antigens. Plates are washed to remove unbound antibodies. Antibodies bound to the SARS-CoV-2 viral proteins are detected using an MSD

SULFO-TAGTM anti-human IgG detection antibody incubated for 60 minutes at RT and with shaking. Plates are washed and a read solution (MSD GOLDTM read buffer) containing electrochemiluminescence (ECL) substrate is applied to the wells, and the plate is entered into the MSD MESO Sector S 600 detection system. An electric current is applied to the plates and areas of well surface which form antigen-anti human IgG antibody SULFO-TAGTM complex will emit light in the presence of the ECL substrate.

The MSD MESO Sector S 600 detection system quantitates the amount of light emitted and reports the ECL unit response as a result for each test sample, control sample and reference standard of each plate. Analysis is performed with the MSD Discovery Workbench software, Version 4.0. Calculated ECLIA parameters to measure binding antibody activities will include interpolated concentrations or assigned arbitrary units (AU/mL) read from the standard curve. A 4-pl curve was used for the analysis. Data analysis was performed using Microsoft Excel and GraphPad Prism Version 8.0. The WA-1 S2P AU/mL readouts were previously bridged to the WHO International Standard on the validated version 1 4plex.¹ The established conversion factor is applied to the WA-1 S2P data set and data presented as BAU/mL for ease of cross study comparison.

High values of binding Antibody to the SARS-CoV-2 N-protein by 4-plex were classified as potentially indicative of prior infection if they were above 19389.75 AU/mL. The cutoff point was obtained using a reference sample of 89 subjects with reportable binding levels from 100 tested sera samples collected prior to 2009 in healthy individuals, and it was defined as 1.5 times the inter-quartile above the 3rd quartile of the antibody concentrations on the log-scale.

Reporting:

For concentrations that are below the Lower Limit of Detection (LLOQ), numeric values equivalent to LLOQ/2 are assigned before and for all descriptive reporting. For concentrations greater than the Upper Limit of Detection (ULOQ), actual values are reported. If actual values above the ULOQ are not provided, observations are replaced with a value equivalent to the ULOQ. Bridging to the WHO standard Binding Antibody Units per milliliter (BAU/mL) was done using a conversion factor of 0.0090, specific to the IgG SARS-CoV-2 Spike antigen.

Pseudovirus Neutralization Immunogenicity Method Description

The Duke NAb Laboratory for HIV and COVID-19 Vaccine Research and Development (Duke NAb Lab; PI: Dr. David Montefiori) assessed the magnitude and cross-variant SARS-CoV-2 neutralizing antibody responses in the DMID Protocol #21-0012 by using a fully validated assay in an environment that operates in compliance with Good Clinical Laboratory Practices (GCLP). The endpoint reported here is the SARS-CoV-2-specific neutralizing activity of antibodies in serum. Neutralizing antibodies were assessed with Spike-pseudotyped viruses in 293T/ACE2 cells as a function of reductions in luciferase (Luc) reporter activity.² Assays were performed on all samples with Spike-pseudotyped virus SARS-CoV-2 D614G. A subset of samples were assayed with Spike-pseudotyped virus SARS-CoV-2 B.1.617.2 AY.3 (Delta lineage variant) and with Spike-pseudotyped virus SARS-CoV-2 B.1.351 (Beta variant). These viruses were prepared by Dr. Montefiori's laboratory using a lentivirus for pseudotyping and a luciferase reporter gene for quantitative measurements of virus neutralization. Results are reported as Inhibitory Dilution 50 (ID50) and Inhibitory Dilution 80 (ID80) neutralization titers. These values represent the serum dilution that reduces relative luminescence units (RLU) by either 50% or 80% relative to the RLU in the virus control wells after subtraction of background RLU. This study was completed under the oversight of the Quality Assurance Unit for Duke Vaccine Immunogenicity Programs (QADVIP).

Neutralization of SARS-CoV-2 Spike-pseudotyped viruses was assessed in 293T/ACE2 cells as described in SOP "CFAR02-A0026 Measuring Neutralizing Antibodies Against SARS-CoV-2 Using Pseudotyped Virus and 293T/ACE2 Cells." This assay has been formally validated. Assay validation was performed with human serum samples and monoclonal antibodies using the D614G form of the Wuhan-1 Spike. This assay is in the process of being validated for B.1.351 but has not been validated using B.1.617.2, although the FDA recently allowed assay use for B.1.617.2. The assay is performed in 96-well flat-bottom clear standard non-coated or Poly-L-Lysine treated culture plates for high throughput capacity. Relative luminescence units are measured in 96-well flat bottom black/white plates for enhanced luminescence with minimal bleed-over. Use of a clonal cell line provided enhanced precision and uniformity.

SARS-CoV-2 Spike-pseudotyped viruses are prepared and titrated for infectivity by using mutated forms of an expression plasmid encoding codon-optimized full-length Spike of the Wuhan-1 strain (VRC7480) provided by Drs. Barney Graham and Kizzmekia Corbett at the Vaccine Research Center, National Institutes of Health (USA). Mutations were introduced into VRC7480 by site-directed mutagenesis using the QuikChange Lightning Site-Directed Mutagenesis Kit from Agilent Technologies. All mutations were confirmed by full-length Spike gene sequencing. The variants used here are:

Variant	Spike mutations
D614G	D614G
B.1.617.2 (Delta)	T19R, G142D, Δ156-157, R158G, L452R, T478K, D614G, P681R, D950N
B.1.351 (Beta)	L18F, D80A, D215G, ΔL242-244, K417N, E484K, N501Y, D614G and A701V

Pseudovirions are produced in HEK 293T/17 cells by transfection using Fugene 6 Transfection Reagent and a combination of Spike plasmid, lentiviral backbone plasmid (pCMV ΔR8.2) and firefly Luc reporter gene plasmid (pHR' CMV Luc) in a 1:17:17 ratio in Opti-MEM (Life Technologies). Transfection mixtures are added to pre-seeded HEK 293T/17 cells in T-75 flasks containing 12 ml of growth medium or T-225 flask containing 36 ml of growth medium and incubated for 16-20 hours at 37°C. Medium is removed and 15 ml (T-75 flask) or 45 ml (T-225 flask) of fresh growth medium added. Pseudovirus-containing culture medium is collected after an additional 2 days of incubation, clarified of cells by 0.45 µm micron filtration, and stored in aliquots at -80°C. Pseudovirions are titrated for infectious dose (TCID₅₀) by making serial 3-fold or 5-fold dilutions in quadruplicate for a total of 11 dilutions in 96-well flat-bottom clear standard non-coated or poly-L-lysine-coated culture plates. An additional 4 wells serve as background controls; these wells received cells but no virus. Freshly suspended 293T/ACE2.MF cells are added (10,000 cells/well) and incubated for 66-72 hours. Medium is removed by gentle aspiration and 30 µl of Promega 1X lysis buffer added to all wells. After a 10-minute incubation at room temperature, 100-110 µl of Bright-Glo luciferase reagent is added to all wells, mixed, and 105 µl of the mixture added to a black/white plate (Perkin-Elmer). Luminescence is measured using a GloMax Navigator luminometer (Promega). TCID₅₀ is calculated using the method of Reed and Muench.

Neutralization is measured by using lentiviral particles pseudotyped with SARS-CoV-2 Spike and containing a firefly luciferase (Luc) reporter gene for quantitative measurements of infection by relative luminescence units (RLU). A pre-titrated dose of virus is incubated with 8 serial 5-fold dilutions of serum samples in duplicate in a total volume of 150 µl for 1 hr at 37°C in 96-well flat-bottom clear standard non-coated or poly-L-lysine-coated culture plates. Cells are detached using TrypLE Select Enzyme solution, suspended in growth medium (100,000 cells/ml) and immediately added to all wells (10,000 cells in 100 µL of growth medium per well). One set of 8 wells receives cells + virus (virus control) and another set of 8 wells receives cells only (background control). After 71-73 hrs of incubation, medium is removed by gentle aspiration and 30 µl of Promega 1X lysis buffer is added to all wells. After a 10 minute incubation at room temperature, 100 µl of Bright-Glo luciferase reagent is added to all wells. After 1-2 minutes, 110 µl of the cell lysate is transferred to a black/white plate. Luminescence is measured using a GloMax Navigator luminometer (Promega). Neutralization titers are the serum dilution at which RLUs are reduced by either 50% (ID₅₀) or 80% (ID₈₀) compared to virus control wells after subtraction of background RLUs. In some cases, ID₅₀ and ID₈₀ titers were calibrated to the WHO International Standards as described³ and expressed as IU₅₀/mL and IU₈₀/mL. Serum samples are heat-inactivated for 30 minutes at 56°C prior to assay.

For assay internal quality controls (IQC), a qualified positive control is tested on each assay plate. The positive control used for assays with D614G is DH1043NHS, which consists of a potent RBD-specific neutralizing monoclonal antibody (mAb), DH1043, diluted in heat inactivated normal human serum (NHS) at 40 µg/ml. The positive control used for assays with B.1.617.2 and B.1.351 is DH1047NHS, which consists of a potent RBD-specific neutralizing mAb, DH1047, diluted in heat inactivated NHS at 100

µg/ml. Both mAbs were produced in the Duke Protein Production Facility with permission for use obtained from Dr. Barton Haynes, Duke Human Vaccine Institute, Duke University Medical Center. DH1043NHS and DH1047NHS aliquots are stored at -80°C until use. Thawed aliquots are stored at 4°C for up to 3 months. Assay run controls consist of COVID-19 convalescent serum samples or SARS-CoV-2 vaccine recipients with high, medium and low ID50 and ID80 titers against the test virus, plus a normal human serum negative control. In addition, internal quality control samples (IQC-High, IQC-Medium, and IQC-Low) from the IQC Program for SARS-CoV-2 Antibody Assay Monitoring (SAAM) program operated by the External Quality Assurance Program Oversight Laboratory (EQAPOL) were included in each experiment. These values were submitted to EQAPOL and statistical summary reports of trendlines were provided using Nelson rules. Levey-Jennings plots were generated quarterly and checked for violations of standards that are based on the Westgard Rules. Violations of the Westgard Rules were investigated.

Specific to Pseudovirus D614G, the assay's lower limit of detection (LLOD), lower limit of quantification (LLOQ) and upper limit of quantification (ULOQ) are as follows:

<u>ID50</u>	<u>ID80</u>
LLOD = 10	LLOD = 10
LLOQ = 18.5	LLOQ = 14.3
ULOQ = 45118	ULOQ = 10232

Values below the Lower Limit of Detection (LLOD) are assigned a value equivalent to $LLOD/2 = 10/2 = 5$. Levels that are reported as above the LLOD but below the Lower Limit of Quantification (LLOQ) are kept as reported. Values that are greater than the upper limit of quantification (ULOQ) are when actual values are provided. If actual values above the ULOQ are not provided, observations are replaced with a value equivalent to the ULOQ.

Selected summaries of neutralizing titers calibrated to the WHO standard International Units (IU50/mL and IU80/mL), are presented. Conversion was done using calibration factors specifically for the SARS-CoV-2 D614G Pseudovirus: a factor of 0.242 for ID50 and a factor of 1.502 for ID80.³

T Cell Intracellular Cytokine Staining Assay Method Description

A validated intracellular cytokine staining (ICS) assay was used to examine SARS-CoV-2-specific CD4+ and CD8+ T-cell responses using a 27-color flow cytometry panel.^{4,5}

Previously cryopreserved specimens were stimulated with two pools of peptides (15 amino acids overlapping by 11 amino acids) which cover the spike S1 and S2 sequences of the original SARS-CoV-2 Wuhan (WA-1) strain along with 4 additional peptides which cover the D614G mutation. The peptides were synthesized by Biosynthesis and provided as individual lyophilized aliquots and reconstituted at 100mg/ml in DMSO before pooling. Pools were diluted with water to a 100mcg/ml per peptide stock concentration and stored at -70 degrees. As a negative control, cells were incubated with DMSO, the diluent for the peptide pools. As a positive control, cells were stimulated with a polyclonal stimulant, staphylococcal enterotoxin B (SEB). There were no replicates except for the negative control, which had two replicates.

The ICS assay was planned to be conducted only for a subsample of 20 per treatment arm randomly selected from the cohort, stratifying by treatment and age strata. From the total of samples assayed, some observations were further excluded due to results not being reliable. Data reported herein includes participants with available samples and excludes those samples for which no valid result was obtained. Several criteria were used to determine if data from an assay were acceptable and could be statistically analyzed. The blood draw date must have been within the allowable visit window as determined by the protocol. After sample thawing and overnight incubation, the viability of the PBMC must have been 66% or greater for testing to have proceeded. If it was not, a new specimen for that participant at that timepoint was thawed for testing. If the PBMC viability of the second thawed aliquot was below this threshold, the ICS assay was not performed and no data were reported to the statistical center for the participant and timepoint. The total numbers of CD4+ and CD8+ T cells must also have exceeded certain thresholds. If the number of CD8+ T cells was < 5,000 or CD4+ T cells was < 10,000 for any of the SARS-CoV-2-peptide pools or for one of the negative control replicates for a particular sample, data for that stimulation were filtered. If both negative control replicates failed for number of T cells, the sample was retested. If one negative control replicate failed for number of T cells, the negative control replicate with sufficient cells was used.

To assess positivity for a peptide pool within a T-cell subset, a two-by-two contingency table was constructed comparing the SARS-CoV-2-peptide stimulated and negative control data. The four entries in each table were the number of cells positive for IFN- γ and/or IL-2 and the number of cells negative for IFN- γ and IL-2, for both the stimulated and the negative control data. If both negative control replicates were included, then the average number of total cells and the average number of positive cells were used. A one-sided Fisher's exact test was applied to the table, testing whether the number of cytokine-producing cells for the stimulated data was equal to that for the negative control data. Since multiple individual tests (for each peptide pool) were conducted simultaneously, a multiplicity adjustment was made to the individual peptide pool p-values using the Bonferroni-Holm adjustment method. If the adjusted p-value for a peptide pool was ≤ 0.00001 , the response to the peptide pool for the T-cell subset was considered positive. Because the sample sizes (i.e., total cell counts for the T-cell subset) were large, e.g., as high as 100,000 cells, the Fisher's exact test has high power to reject the null hypothesis for very small differences. Therefore, the adjusted p-value significance threshold was chosen stringently (≤ 0.00001).

Random Effects Model - Analysis of Serologic Endpoints at the Site Level

Results from an alternative analysis for the main serological endpoints that incorporates random effects (RE) at the site level are depicted below. The Random Effects Table for IgG Binding and Neutralizing Antibody Responses (below) depicts the increase in IgG Binding Antibody levels (BAU/mL) to the S-2P-WA1 antigen and Pseudovirus Neutralizing Antibody titers (IU50/mL) to the D614G Pseudovirus, for participants in Groups 1E-9E, from baseline to Day 15, from the raw estimates (presented in Table 2 of the manuscript) and from the RE analysis. Additionally, the results from the RE analysis suggest relatively little variability between sites, and most of the total variability resulting from participant-to-participant variability.

Random Effects Alternative Model Table- SARS-CoV-2 IgG Binding and Neutralizing Antibody Responses

¹ Only those AEs which have been assigned MedDRA codes by clinical staff are summarized within organ system class. A total of 4 AEs had not been assigned MedDRA codes at the time of the data snapshot for these groups.

² For participants reporting multiple events, overall or withing the same MedDRA term, the maximum severity grade is counted.

Supplemental Table 5. Participants experiencing unsolicited AEs after study boost vaccination in Stage 2 (groups 4 to 6 boosted with Ad26.COVS.2.S) overall and for each Preferred Term within System Organ Class (MedDRA code classification), by Group, relationship to study product and maximum severity (numbers in brackets correspond to severity grades mild, moderate, severe, potentially life-threatening and death, respectively).

System Organ Class/MedDRA Preferred Term ¹	Group 4 Ad26.COVS.2.S (n=50)		Group 5 mRNA-1273 (n=49)		Group 6 BNT162b2 (n=51)

¹ For a given sign or symptom, each participant's solicited AE will be counted once under the maximum severity for all post-administration assessments.

² For erythema/redness and induration/swelling, at each assessment time the maximum diameter at the injection site is recorded. For a given largest diameter, each participant will be counted once under the maximum largest diameter for all post-administration assessments.

¹ Calibration to the WHO standard International Units (IU50/mL and IU80/mL) was done using a calibration factor of 0.242 for ID50 and a calibration factor of 1.502 for ID80, both specific to the SARS-CoV-2 D614G pseudovirus.

² Values below the lower limit of detection (LLOD = 10) are assigned the value of LLOD/2. Values between the LLOD and the lower limit of quantification (LLOQ = 18.5) are taken as reported, or a value of LLOQ/2 is assigned if observations are reported as <LLOQ but no value is provided. Values greater than the upper limit of quantification (ULOQ = 45118) are taken as reported, or a ceiling value equivalent to the ULOQ is assigned if values are not provided.

¹ Calibration to the WHO standard International Units (IU50/mL and IU80/mL) was done using a calibration factor of 0.242 for ID50 and a calibration factor of 1.502 for ID80, both specific to the SARS-CoV-2 D614G pseudovirus.

² Values below the lower limit of detection (LLOD = 10) are assigned the value of LLOD/2. Values between the LLOD and the lower limit of quantification (LLOQ = 18.5) are taken as reported, or a value of LLOQ/2 is assigned if observations are reported as <LLOQ but no value is provided. Values greater than the upper limit of quantification (ULOQ = 45118) are taken as reported, or a ceiling value equivalent to the ULOQ is assigned if values are not provided

¹ Values below the lower limit of detection (LLOD = 10) were assigned the value of LLOD/2. Values between the LLOD and the lower limit of quantification (LLOQ = 18.5) are taken as reported, or a value of LLOQ/2 is assigned if observations are reported as <LLOQ but no value is provided. Values greater than the upper limit of quantification (ULOQ = 45118) are taken as reported, or a ceiling value equivalent to the ULOQ is assigned if values are not provided.

² Positive response is defined as an ID titer above the LLOD

³ Relative to pre-vaccination (Day 1 Visit) levels, among participants with no-missing observations at both pre- and post-boost timepoints.

¹ Values below the lower limit of detection (LLOD = 10) were assigned the value of LLOD/2. Values between the LLOD and the lower limit of quantification (LLOQ = 14.3) are taken as reported, or a value of LLOQ/2 is assigned if observations are reported as <LLOQ but no value is provided. Values greater than the upper limit of quantification (ULOQ = 10232) are taken as reported, or a ceiling value equivalent to the ULOQ is assigned if values are not provided.

¹ Values below the lower limit of detection (LLOD = 10) were assigned the value of LLOD/2. Values between the LLOD and the lower limit of quantification (LLOQ = 14.3) are taken as reported, or a value of LLOQ/2 is assigned if observations are reported as <LLOQ but no value is provided. Values greater than the upper limit of quantification (ULOQ = 10232) are taken as reported, or a ceiling value equivalent to the ULOQ is assigned if values are not provided.

*Vaccine Treatment and Evaluation Units and their domestic subsites that are part of the Infectious Diseases Research Consortium (IDCRC, see <https://idcrc.org/>) were queried about interest and capacity to participate in this study. Ten sites (eight of ten primary VTEU sites and two of 11 subsites) expressed interest and capacity to participate in the clinical trial.

Supplemental Figure 1: Consort Diagram for Stage 1 (Groups 1-3)

Supplementary Figure 1. Stage 1 Enrollment, Booster Vaccinations and Study Endpoints Analyses

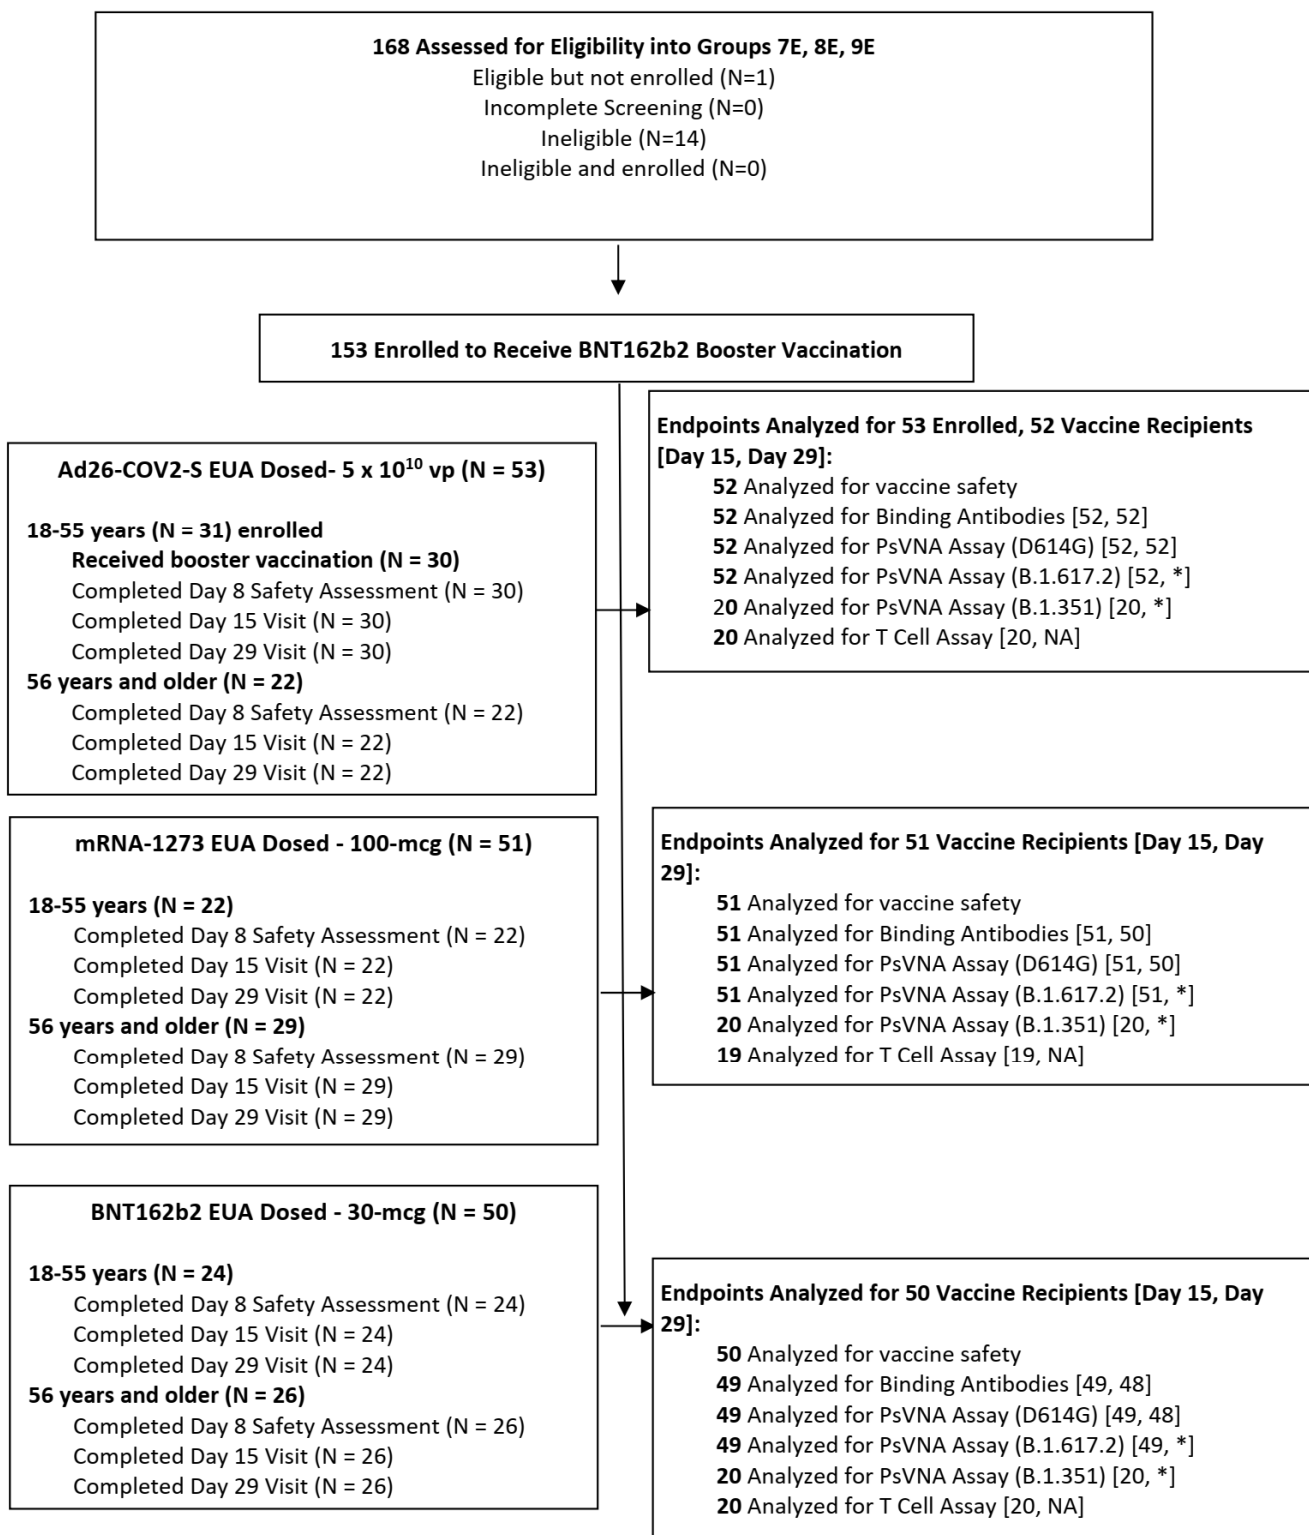

Supplemental Figure 2: Consort Diagram for Stage 2 (Groups 4-6)

* Results at these timepoints not yet available. To be updated for the Final Report.

Supplementary Figure 2. Stage 2 Enrollment, Booster Vaccinations and Study Endpoints Analyses

Supplemental Figure 3: Consort Diagram for Stage 3 (Groups 7E, 8E, 9E)

* Results at these timepoints not yet available. To be updated for Final Report

Supplementary Figure 3. Stage 3 Enrollment, Booster Vaccinations and Study Endpoints Analyses
