<b>Supplemental Table 1.</b> Framingham Heart Study criteria for HF diagnosis	<b>2</b>
<b>Supplemental Table 2.</b> Comparison of cumulative incidence of HF across the two epochs, adjusted for competing risk of death and according to risk factor strata: participants without prior myocardial infarction	<b>3</b>
<b>Supplemental Table 3.</b> Prevalence of major and minor criteria for HF in the two epochs	<b>6</b>
<b>Supplemental Table 4.</b> Published estimates of RLR for HF at age 45/50 years.	<b>7</b>
<b>Supplemental Figure 1.</b> Derivation of sample sizes in the two epochs (overall and for risk factor strata).	<b>9</b>
<b>Supplemental Figure 2.</b> RLR of HF according to risk factor strata (Panels A-H) in participants without prior myocardial infarction: comparison between the two epochs.	<b>10</b>
<b>Supplemental Figure 3.</b> Association of risk factors with HF incidence using Fine-Gray subdistribution hazards regression models in the two epochs in participants without prior MI. <b>Panel A</b> represents comparisons within each epoch, and <b>Panel B</b> represents comparisons of hazards ratios associated with a risk factor stratum in epoch 2 vs. epoch 1.	<b>14</b>
<b>Supplemental Figure 4.</b> RLR of HFpEF and HFrfEF according to risk factor strata (Panels A-H) in the second epoch	<b>16</b>
<b>Supplemental Figure 5.</b> Association of risk factors with HFpEF and HFrfEF incidence using Fine-Gray subdistribution hazards regression models: results for participants in the second epoch	<b>20</b>

**Supplemental Table 1. Framingham Heart Study criteria for HF diagnosis.**

<b>Major Criteria</b>	<b>Minor Criteria</b>
Paroxysmal nocturnal dyspnea or orthopnea	Pleural effusion by X-ray
Distended neck veins	Pulmonary vascular engorgement by X-ray
Hepatojugular reflux	Heart rate > 120/minute
Rales	Hepatomegaly
S3 gallop	Ankle edema
Treatment-induced weight loss >10lbs/5 days	Decrease in vital capacity by 1/3rd
Increased venous pressure > 16 cm water	Dyspnea on ordinary exertion
Pulmonary edema, visceral congestion, or cardiomegaly on autopsy	Night cough
Enlarged heart by X-ray	
Acute pulmonary edema on chest X-ray	

HF was diagnosed by the presence of 1 major criterion and 2 minor criteria, or 2 major criteria in the absence of an alternative explanation for findings.

**Supplemental Table 2. Comparison of cumulative incidence of HF at age 50 years across the two epochs, adjusted for competing risk of death and according to risk factor strata: participants without antecedent myocardial infarction**

ACI= adjusted cumulative incidence, %. N = number of HF events, Pyrs= person-years of observation.

Lifetime risk was evaluated at 45 years except for the analyses of the stratum according to diabetes status, in which 30 years was used due to limited data.

\*participants received a score of 0-2 for the three BMI categories (0 for normal BMI, 1 for overweight, and 2 for obesity), a score of 0-2 for BP categories (0 for normal BP, 1 for intermediate BP, and 2 for hypertension), and a score of 0-1 for diabetes (0= no, 1= yes). Thus, participants could have a score that ranged from 0 (minimum) to 5 (maximum). Three strata of the risk score were empirically defined as 0-1 (low risk factor burden), 2-3 (intermediate), 4-5 (high risk factor burden).

Journal Pre-proof

**Supplemental Table 3. Prevalence of major and minor criteria for HF in the two epochs**

	<b>Epoch 1</b>	<b>Epoch 2</b>	<b>P* for Epoch 1 vs. 2</b>
<b>Major Criteria, %</b>			
Paroxysmal nocturnal dyspnea or Orthopnea	83%	73%	0.02
