

# Supporting Information

## Additional Figures

Figure 1: Presence and absence of DNMT family members and prediction of DNA methylation status of all species analyzed.

Figure 2: Correlation of two parameters of the distributions resulting from Gaussian Mixture Modelling (GMM): mean of the component with the lower mean and the relative amount of data points in this components.

Figure 3: Correlation of two parameters of the distributions resulting from Gaussian Mixture Modelling (GMM): mean of the component with the higher mean and the relative amount of data points in the component with the lower mean.

Figure 4: Correlation of two parameters of the distributions resulting from Gaussian Mixture Modelling (GMM): distance of the means of both components and the standard deviation of the whole distribution.

Figure 5: Correlation of two parameters of the distributions resulting from Gaussian Mixture Modelling (GMM): distance of the means of both components and the relative amount of data points in the component with the lower mean.

Figure 6: Correlation of two parameters of the distributions resulting from Gaussian Mixture Modelling (GMM): distance of the means of both components and the mean of the whole distribution.

Figure: Due to their size, the graphical representation of the Gaussian Mixture Modelling for each species is stored in a separate file: Supplement-AddFig-CpG\_Distributions.pdf

## Additional Tables

Table 1: A list of all species analyzed and the source of the data.

Table 2: For all species a list of parameters of the Gaussian Mixture Modelling (GMM) and the resulting distributions.

Table 3: For all species a list of additional parameters of the Gaussian Mixture Modelling (GMM) and the resulting distributions.

Table 4: A comparison of our finding of the presence and absence of DNMT family members and prediction of DNA methylation status to existing literature in Nematoda.

Table 5: A comparison of our finding of the presence and absence of DNMT family members and prediction of DNA methylation status to existing literature in Arthropoda.

Table 7: A comparision of our finding of the presence and absence of DNMT family members and prediction of DNA methylation status to existing literature in Arthropoda, Nematoda and early-branching Metazoa.

Table 8: Overview of the classification of DNMT candidates according to the detected domains.

## **Sequence data**

The amino acid sequence of all predicted DNMT candidates is stored in the file 'DNMT-cands.fa'.

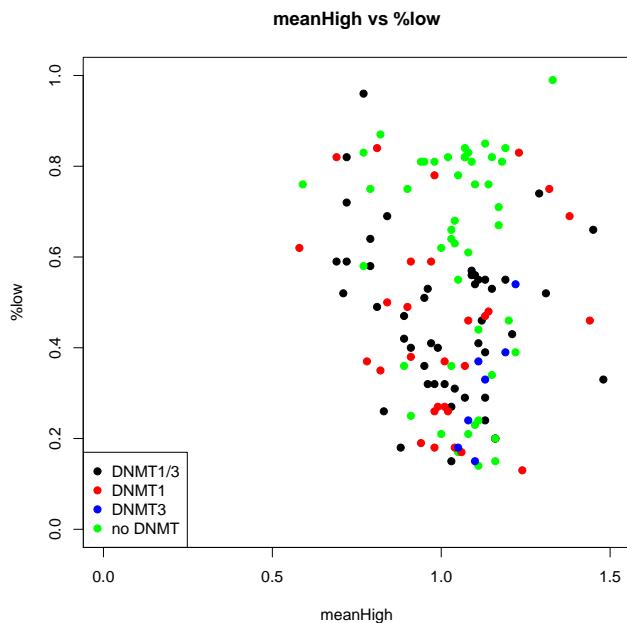

It can be downloaded as well: [www.bioinf.uni-leipzig.de/~jane/Engelhardt2020\\_DNMT-cands.fa](http://www.bioinf.uni-leipzig.de/~jane/Engelhardt2020_DNMT-cands.fa)

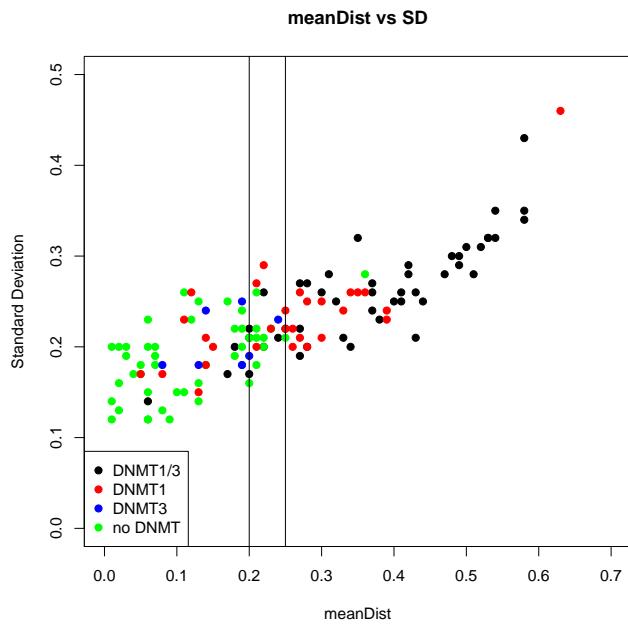

**Figure 1:** Presence and absence of DNMT family members in Metazoa indicated by filled and open symbols, respectively for DNMT1 (red), DNMT2 (green), and DNMT3 (blue). Data sources are indicated by symbol shape: proteome  $\bigcirc$ , genome  $\square$ , transcriptome  $\triangle$ . The rightmost column (golden circles) shows the presence and absence of DNA methylation as predicted from the O/E CpG ratio. Absence of golden circle indicates missing data. The species list is given on turquoise background with alternating shades indicating the order membership. The name of the order (or suitable higher group marked with an asterisk \*) is given in bold. Alternating shades of brown indicate (from top to bottom) Nematoda, Chelicerata, Myriapoda, Multicrustacea, Branchiopoda, and Hexapoda. Stars in the species tree denote proposed loss events inferred from absence of a DNMT in all species of a subtree comprising at least two leaves, disregarding absences in species with transcriptomic data only.

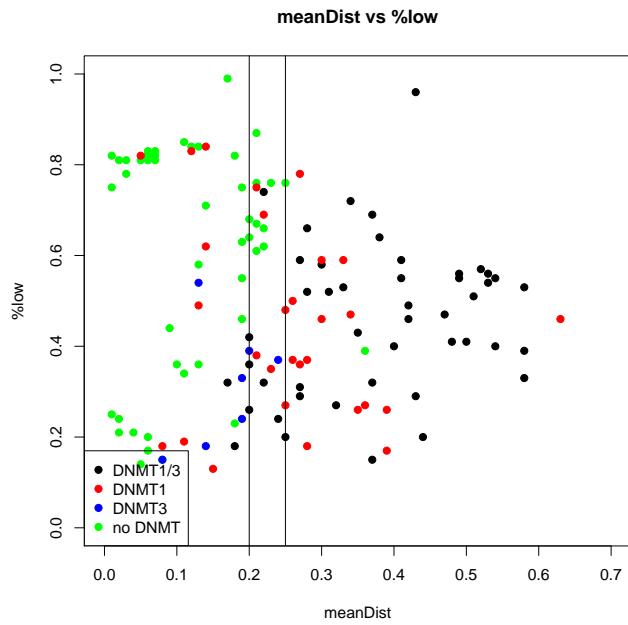

**Figure 2:** Each point shows one species analyzed by Gaussian Mixture Modelling (GMM). The x-axis is the mean of the component with the lower mean and the y-axis the relative amount of data points in this component. The values are shown in Tab. 2. The color represents if neither DNMT1 or DNMT3 (green) have been found in the species, only DNMT1 (red), only DNMT3 (blue) or both (black).

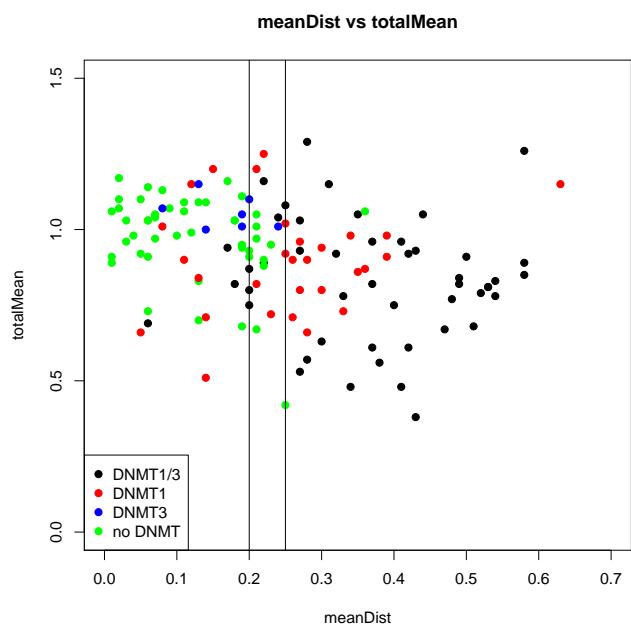

**Figure 3:** The x-axis is the mean of the component with the higher mean and the y-axis the relative amount of data points in the component with the lower mean. For more details see Fig. 2

**Figure 4:** The x-axis is the distance of the means of both components and the y-axis the standard deviation (SD) of the whole distribution. For more details see Fig. 2

**Figure 5:** The x-axis is the distance of the means of both components and the y-axis the relative amount of data points in the component with the lower mean. For more details see Fig. 2

**Figure 6:** The x-axis is the distance of the means of both components and the y-axis the mean of the whole distribution. For more details see Fig. 2

**Table 1:** The given url is the link to the predicted protein data. The abbreviations in the second column stand for the following databases: N - NCBI, W - Wormbase, E - ENSEMBL, O - Other. In case of datadryad.org no additional data was available. For the NCBI, Wormbase and ENSEMBL, genome and CDS data was downloaded for the same version of the respective species. The N50 value in the last column corresponds to the respective genome assembly. Due to their length some URL are shortened. If they are from one of the following database they start with the given address: NCBI - <ftp://ftp.ncbi.nlm.nih.gov/genomes/all/..>; ENSEMBL - <ftp://ftp.ensemblgenomes.org/pub/metazoa/release-44/fasta/..>; Wormbase ParaSite - <ftp://ftp.ebi.ac.uk/pub/databases/wormbase/parasite/releases/WBPS14/species/..>;

**Table 2:** Parameters of the GMM modelling for each species real and shuffled data. The letter after the species name stands for real ('R') and shuffled ('S') data. The parameters are: meanLow - the mean of the component with lower mean O/E CpG, meanHigh - the mean of the component with higher mean O/E CpG, meanDist - the distance of the two components, %low - the relative amount of data points in the component with lower mean O/E CpG, %high - the relative amount of data points in the component with higher mean O/E CpG, AIC-N1 - the AIC for a GMM with 1 component, AIC-N2 - the AIC for a GMM with 2 components, best-N - the amount of components which results in a lower AIC

**Table 3:** Additional parameters of the GMM modelling but only the real data. The first 5 columns are identical to Sup-Table2, rounded to two positions behind the decimal point. In addition it contains mean - the mean of the whole O/E CpG distributions, SD - the (sample) standard deviation of the whole distribution, skew - the skewness of the whole distribution, mLow-m - distance between meanLow and mean, mHigh-m distance between meanHigh and mean

**Table 4:** The table contains all species analyzed in this study which have been analyzed as well in either Bewick et al. (2017), Provataris et al. (2018), Rošić et al. (2018) or if experimental verification of DNA methylation is available. X - indicates presence; O - indicates absence; DNMT1/DNMT3 means the occurrence of at least one paralog of the respective enzyme. Methyl. means if the respective study defines the genome as containing DNA methylation or not according to the O/E CpG content (In case of *Provataris et al.* 'X' is 'Unimodal, indicative of methylation' and 'XX' is 'bimodal depleted'). If the species name is bold there is a contradiction in DNMT occurrences or methylation status between our data and another study. The column of our study which is contradicting is bold as well.
