This table calculates residuals from a regression of week-ahead change in deaths ($\text{Growth}(t+j)$) during weeks $t+j$, where $j = -2$ through $+2$ relative to the introduction of policy i . Control variables are: current cumulative deaths in the county, lagged changes in deaths per capita, time controls, weather information, and demographic data are included in the regression. We also include all policies that are already in place as of period t from Table 2 other than the newly implemented policy i , where policy i is the policy listed in the first column. Mean_{t+i} denotes the week $t+j$ average change fatality growth times 100. *** denotes significance at the 1% level; ** denotes 5% significance; * denotes 10% significance.
