## **Table of Contents**

**Figure S1.** Physical image of SAW sensor. (S3)

**Figure S2.** SAW sensor vibration frequency spectrum. (S4)

**Table S1.** Retention time of four standard biomarkers by AIO system. (S5)

**Table S2.** The results of non-parametric test for the four biomarkers. (S6)

**Reference** (S7)

**Figure S1.** Physical image of SAW sensor.

**Figure S2.** SAW sensor's starting frequency spectrum measured by the spectrum analyzer. The center frequency of the sensor is 500.647 MHz. In the case of no load on the sensor surface, the frequency amplitude of the vibration is 7.35 dB, which is consistent with the design parameters. And the frequency band is narrower and the energy is more concentrated. Reprinted in part with permission from <sup>1</sup>. Copyright 2017 Japan Society for Analytical Chemistry

**Table S1.** The results of non-parametric test for the four biomarkers

<b>Putative identification</b>	<b>p-value</b>	
	<b>Mann-Whitney U test</b>	<b>Kolmogorov-Smirnov Z test</b>
Octanal	0.571	0.033
Hexyl acetate	0.987	0.044
Perillic aldehyde	0.014	0.114
Dodecane	0.519	0.996

**Table S2.** By dissolving them in an appropriate solvent, various standard solutions are prepared for creating chemical mixtures of gauze spiked with human sebum. The following table shows the solvents used to create each standard separately, and then formed a mixture of various concentrations for calibration experiments. And the retention time periods were useful to find the standard from the full-data.

<b>Standard</b>	<b>CAS</b>	<b>Mass</b>	<b>Solvent</b>	<b>Retention time(s) (a time period)</b>
<b>Octanal</b>	124-13-0	128.21	Ethanol	5.59-5.78
<b>Hexyl acetate</b>	142-92-7	144.21	Methanol	5.89-6.04
<b>Perillic aldehyde</b>	2111-75-3	150.22	Ethanol	10.39-10.78
<b>Dodecane</b>	112-40-3	170.33	Ethanol	9.52-9.90
