

Comparison of mental health outcomes in seropositive and seronegative adolescents during the COVID19 pandemic

Judith Blankenburg¹, MD, Magdalena K. Wekenborg², PhD, Jörg Reichert¹, PhD, Carolin Kirsten¹, Elisabeth Kahre¹, MD, Luise Haag¹, MD, Leonie Schumm¹, MD, Paula Czyborra¹, MD, Reinhard Berner¹, MD, Jakob P. Armann^{1,*}, MD

Supplementals - Figure 1 Prevalence of neurocognitive, pain and mood symptoms in LIAISON[®]-negative and positive study participants (Fisher's exact test: n = 1553, * p < .05)

Supplementals - Table 1 Demographic data and serostatus of the participating students at study visit in March/ April 2021; IQR – Interquartile range (n = 1553)

	Seronegative Students	Seropositive Students
Median Age, (IQR), (range)	15, (14-16), (10 - 38)	15, (14-17), (10 - 35)
Female n (%)	762 (56)	104 (55)
Median Household size, (IQR)	4, (3-5)	4, (4-5)
