

Fig S1. C-di-GMP does not cause inversion of the *cmr* switch. $\Delta cmrR::SNAP$ carrying pP_{tet}::*dccA* or vector control was grown to mid-exponential phase in BHIS broth with or without 20 ng/mL ATc. gDNA was collected for qPCR analysis of *cmr* switch orientation. Data are expressed as the percent OFF orientation. Shown are the means and standard deviations of six biological replicates from two independent experiments. No significant differences, two-way ANOVA with Tukey's multiple comparisons.
