**1. Experimental details**

*1.1. Physicochemical characterization of TFENs*

The hydrodynamic particle size (nm), size distribution, and zeta potential (mV) of TFENs were characterized by using DLS instrument (Malvern, Nano ZS90, Worcestershire, UK).

The morphology of TFENs was visualized using a TEM (Zeiss, LEO 906E, Jena, Germany) after negatively stained with uranyl acetate (1%, w/v).

To evaluate the stability of TFENs in different sections of GIT and blood, they were suspended in simulated gastric fluid (pH = 1.2), simulated small intestinal fluid (pH = 7.4), simulated colonic fluid (pH = 6.8), and DMEM containing FBS (10%, v/v), respectively. After incubation for different time periods (0, 2, 4, and 8 h) at 37 °C, hydrodynamic particle size (nm) and zeta potential (mV) were determined by DLS measurements.

Total lipids were extracted from TFENs for lipidomic analysis, which was carried out by Shanghai Sensichip Infotech Co. (Shanghai, China). Briefly, TFEN suspension (100 µL, protein concentration: 3.0 µg/µL) was fully dissolved in a mixed solution (volume ratio of methyl tertiary butyl ether/methanol/water = 10:4:3, v/v, 2.0 mL), and centrifuged at 12,000×g for 20 min. The obtained supernatant was blow-dried and re-dissolved in a mixed solution (volume ratio of methanol/isopropanol = 1:1, v/v, 0.2 mL) for liquid chromatography-mass spectrometry (LC–MS, Thermo Fisher Scientific, Ultimate 3000LC, Q Exactive, San Jose, CA, USA) analysis. Finally, the results were analyzed using Lipid Search software (Thermo Fisher Scientific, Lipid Search software, San Jose, CA, USA), and the relative content of each lipid was displayed as the percentages of total lipids.

Isolated proteins from NTs were separated by sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE). The samples were shipped to Majorbio BioPharm Technology Co., Ltd. (shanghai, China) in dry ice. Proteins were identified and quantified by LC–MS/MS using an Orbitrap mass spectrometry (Thermo Fisher Scientific, Bremen, Germany). Finally, National Center for Biotechnology Information (NCBI) database was used to analyze the data.

To analyze the contents of polyphenols and flavonoid glycosides, total polyphenols and

flavonoid glycosides were extracted from TFENs, and the mixtures were centrifuged at 3000×g for 20 min. Finally, the obtained supernatants were submitted into high-performance liquid chromatography (HPLC, Shimadzu, Kyoto, Japan).

### *1.2. Cell culture*

Human breast cancer cell line (MCF-7 cell), mouse mammary carcinoma cell line (4T1), human lung carcinoma cell line (A549), human cervical cancer cell line (HeLa), human umbilical vein endothelial cell line (HUVEC), and human embryonic kidney cell line (HEK293T) were obtained from the Cell Bank of the Chinese Academy of Sciences (Shanghai, China). These cells were cultured in DMEM containing FBS (10%, v/v) and penicillin-streptomycin (1%, w/v) in CO<sub>2</sub> incubator at 37 °C.

### *1.3. In vitro cellular uptake profiles of TFENs*

To quantitatively and qualitatively investigate the cellular uptake profiles of TFENs, a green fluorescence probe (DiO) was used to label these NPs. DiO solution ( $1 \times 10^{-5}$  mol/L) was added to TFEN suspension (protein concentration: 1 mg/mL, 1 mL). Subsequently, the mixture was incubated for 30 min at 37 °C. Finally, the free DiO was removed using a 100 kDa ultracentrifuge filter, and the purified DiO-labeled TFENs were obtained.

MCF-7 cells and 4T1 cells were seeded in 6-well plates at the same density of  $5 \times 10^5$  per well and incubated overnight. Thereafter, the complete culture medium was exchanged to serum-free medium containing DiO-labeled TFENs (protein concentration: 16 µg/mL). After co-incubation for different time intervals (1, 3, and 5 h), cells were washed 3 times with PBS to eliminate the excess NPs, collected, and re-suspended in PBS for flow cytometry (ACEA Novocyte<sup>TM</sup>) analysis based on 10,000 gated cell events.

MCF-7 cells and 4T1 cells were seeded in 8-well plates (BD Falcon, MA, USA) at the same

cell density of  $8 \times 10^4$  cells per well and incubated overnight. Subsequently, the complete culture medium was exchanged to serum-free medium containing DiO-labeled TFENs (protein concentration: 16  $\mu\text{g/mL}$ ). After co-incubation for 5 h, cells were washed 3 times with PBS to eliminate the excess NPs and fixed with paraformaldehyde solution (4%, v/v) solution for 20 min. AF633-phalloidin and DAPI were used to stain cytoskeleton and nucleus, respectively. Finally, the fluorescent images of cells were acquired using a confocal laser scanning microscope (Zeiss).

#### *1.4. Trajectory analysis of TFENs*

DiO-TFENs were dispersed in the buffer (pH 6.8) to obtain different NP suspensions (0.1%, w/v). Meanwhile, mucus-simulating hydrogel (hydroxyethylcellulose, 0.2%, w/v) was added to petri dish as travelling medium. Subsequently, a drop of DiO-TFEN suspension was added to the petri dish, and the movements of DiO-TFENs were recorded by a CCD camera at a phase difference of about 30 fps with fluorescence microscope (Olympus IX83, Tokyo, Japan). The trajectories of DiO-TFENs were extracted to calculate the mean-square-displacement (MSD) values.

#### *1.5. Live/dead assay*

MCF-7 cells, 4T1 cells, A549 cells, and HeLa cells were seeded in 12-well plate at a density of  $2 \times 10^5$  cells per well and incubated overnight. Subsequently, cells were incubated with TFEN suspensions (protein concentration: 16  $\mu\text{g/mL}$ , 2 mL). After incubation for 24 h, cells were rinsed with PBS to eliminate the excess NPs and stained using a live/dead cell viability assay kit. Finally, their images were acquired immediately using a fluorescent microscope (Olympus, IX73, Tokyo, Japan).

#### *1.6. In vivo biodistribution*

To track the *in vivo* biodistribution of TFENs after intravenous injection (i.v.) or oral administration, a near-infrared fluorescence probe (DiR) was used to label TFENs. An orthotopic breast tumor model and a model of metastatic breast cancer were established and administered with DiR-labeled TFENs at an equivalent DiR concentration (3 mg protein/kg per mouse) *via* i.v. or oral route. After administration for 6, 12, 24, 48, and 72 h, respectively, mice were sacrificed to obtain tumors and main organs (heart, liver, spleen, lung, and kidney). The images were captured using an IVIS spectrum imaging system (PerkinElmer/Caliper LifeSciences, Hopkinton, MA, USA). Free DiR was treated as a control in this study.

#### *1.7. In vivo absorption site of TFENs after oral administration*

To determine the absorption sites of orally administered TFENs in gastrointestinal tract (GIT), DiO-labeled TFENs were administrated to BALB/c mice *via* oral route. Six hours after oral administration, mice were sacrificed and their whole GIT (stomach, duodenum, jejunum, ileum, and colon) was harvested. Tissues were embedded in Optimal Cutting Temperature compound. Eventually, tissue sections (8  $\mu$ m) were stained with DAPI, and their fluorescence images were obtained using an fluorescent microscope (Olympus).

#### *1.8. In vitro hemolysis assay*

Briefly, fresh blood was collected from the eyelid posterior sinus vein of mice and centrifuged at  $100 \times g$  for 20 min, washed 3 times, and suspended in PBS (2%, v/v). Meanwhile, TFENs with different concentrations (0.5–50  $\mu$ g/mL) were co-cultured with erythrocytes solutions for 1 h at 37 °C prior to centrifugation at  $3000 \times g$  for 15 min. Finally, hemoglobin amounts in the supernatants were analyzed by spectrophotometric tests at 570 nm. The untreated erythrocyte suspension was utilized as a negative control, whereas erythrocyte suspension treated with Triton X-100 (1%, w/v) was used as a positive control.

### *1.9. In vivo biosafety evaluation*

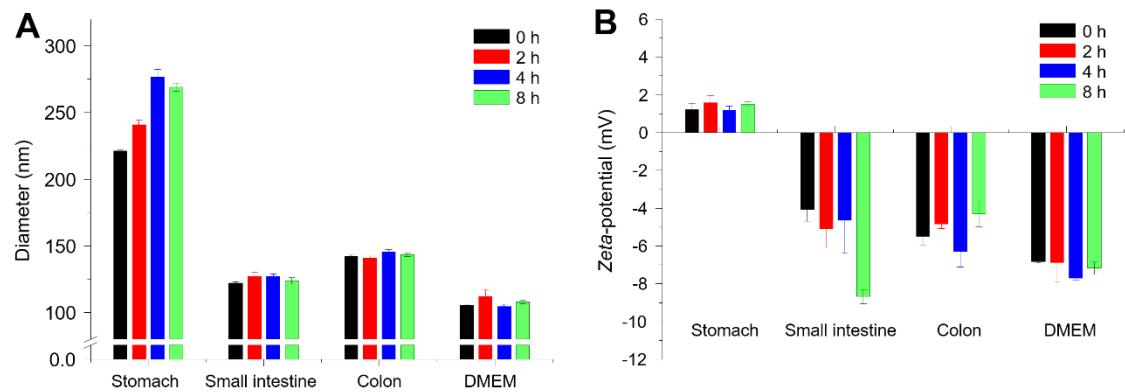

Female BALB/c mice (8 weeks) were orally or intravenously administered with TFENs at the same dose of 3 mg/kg every two days. After 7 doses of TFEN treatment, mice were sacrificed. The main organs (heart, liver, spleen, lung, and kidney) and blood were obtained, and the organ index was calculated. The concentrations of the main pro-inflammatory factors (TNF- $\alpha$ , IL-6, and IL-12), alkaline phosphatase (ALP), glutamic-pyruvic transaminase (ALT), glutamic-oxaloacetic transaminase (AST), urea nitrogen (BUN), creatinine (CRE), and complement C3 in plasma were measured using their corresponding kits, respectively. The whole blood components were analyzed by the hematology analyzer (Mindray Biomedical Electronics Co., Ltd., BC-5000VET, Shenzhen, Guangdong, China). In addition, the tissues of the main organs and different sections of GIT were analyzed by H&E staining.

### *1.10. Survival rate*

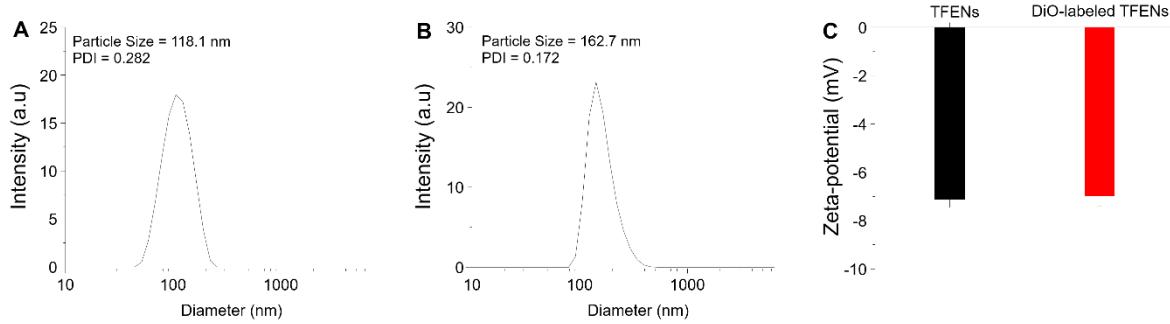

To determine the survival rate of different mouse groups, mouse lung metastasis model of breast cancer was established, and these mice were randomly divided into 3 groups (10 mice per group). Mice were treated with TFENs (3 mg/kg) *via* i.v. injection or oral administration, respectively. The survival numbers of these 3 mouse groups were updated every day.

### *1.11. Statistical analysis*

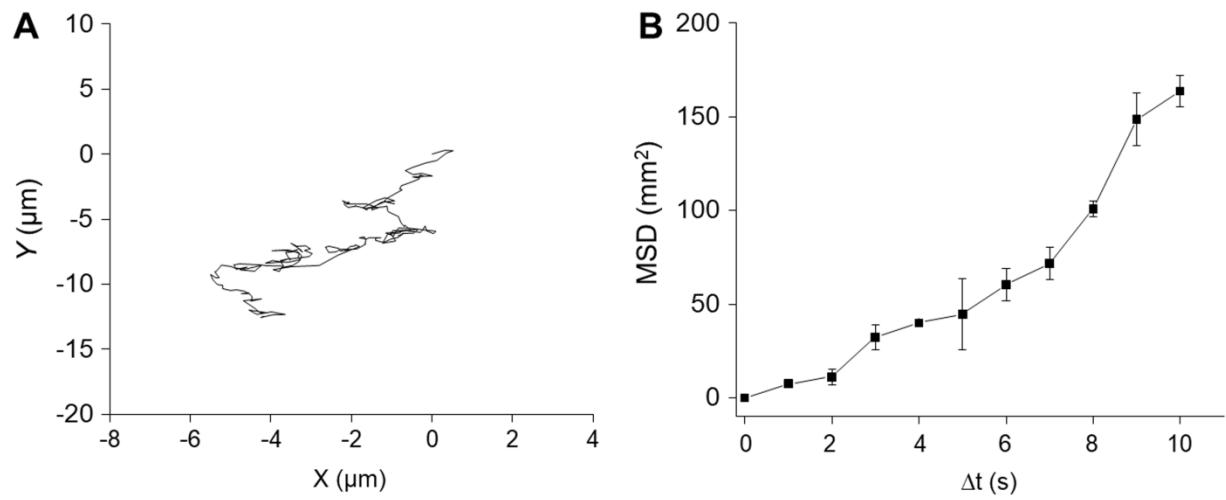

Data were presented as mean  $\pm$  standard error of mean (SEM). Statistical significance was analyzed using a Student's *t*-test for *in vitro* data processing and an ANOVA test for *in vivo* data processing. Statistical significance was represented by \* $P < 0.05$  and \*\* $P < 0.01$ .
