

S-Figure 1

To investigate whether whole body burden of sarcoidosis influenced the levels of U-8-OHdG, we compared U-8OHdG levels between systemic CS (CS with extracardiac sarcoidosis) (N=37) and isolated CS (N=24) (Table 1). There was no difference in U-8-OHdG levels between systemic CS and isolated CS (systemic CS; 14.9 ± 6.8 ng/mg·Cr vs isolated CS; 15.0 ± 7.5 ng/mg·Cr, $P=0.99$).
