5

6 **Toy Network Results**

7 Simulated measurements that were fit to the model are listed in **S1 Data**. All pool sizes were constrained  
 8 by a lower bound of 0.0001 and an upper bound of 10.0 when fitting the model. The time domain was  
 9 discretized by assigning time nodes at values of 0.0, 1.0, 2.0, 4.0, 8.0, and 20.0. The 5<sup>th</sup>-order Radau IIA  
 10 collocation method was used.

Reaction Name	Actual Flux	Actual Exchange	Predicted Flux	Predicted Exchange

14

15

16 ***E. coli* Model**

17 The following *E. coli* metabolic flux analysis (MFA) network was adapted from that presented by Young et  
 18 al. [1]. For fitting the model, the pool size of each metabolite was given a lower bound of 0.001 and an  
 19 upper bound of 10.0. Confidence intervals were estimated by performing Monte Carlo simulations using  
 20 the measurement means and standard deviations.

23 **Results**

24 The *E. coli* model was fit to simulated liquid chromatography-tandem mass spectrometry (LC-MS/MS)  
 25 data with random noise added to the measurements to simulate experimental error. This data is listed in  
 26 **S1 Data**. The simulated LC-MS/MS data includes the parent and daughter ions described by Rühl et al  
 27 [2].

28 All pool sizes were constrained by a lower bound of 0.001 and an upper bound of 10.0 when fitting the  
 29 model. The time domain was discretized by assigning time nodes at values of 0.0, 0.015, 0.045, 0.150,  
 30 0.400, 1.100, and 3.100. The 3<sup>rd</sup>-order Radau IIA collocation method was used initially to identify the  
 31 optimum, followed by the 9<sup>th</sup>-order Radau IIA method for refining the solution.
