

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

Abstract

Objectives

We explore the routes to cancer diagnosis to further understanding of the inequality in the reduction in detection of new cancers since the start of the pandemic. We use different data sets to assess stages in the cancer pathway: primary care data for primary care consultations, routine and urgent referrals and published analysis of cancer registry data for appointments and first treatments.

Setting

Primary and cancer care

Participants

In this study we combine multiple data sets to perform a population-based cohort study on different areas of the cancer pathway. For primary care analysis, we use a random sample of 500,000 patients from the Clinical Practice Research Datalink (CPRD). Post-referral we perform a secondary data analysis on the Cancer Wait Times data and the NCRAS COVID-19 data equity pack.

Outcome measures:

Primary care: consultation, urgent cancer referral and routine referral rates, then appointments following an urgent cancer referral, and first treatments for new cancer, for all and by quintile of patient's local area Index of Multiple Deprivation.

Results

Primary care contacts and urgent cancer referrals fell by 12.4% (-12.6, -12.3) and 20.2% (-22.3, -18.1) respectively, while routine referrals have not recovered to pre-pandemic levels. Reductions in first treatments for newly diagnosed cancers are down 16.3% (-16.6, -15.9). The reduction in the number of two week wait referrals and first treatments for all cancer has been largest for those living in poorer areas, despite having a smaller reduction in primary care contact.

Conclusions

Our results further evidence the strain on primary care and the presence of the inverse care law, and the dire need to address the inequalities so sharply brought into focus by the pandemic. We need to address the disconnect between the importance we place on the role of primary care and the resources we devote to it.

Key Words: Oncology, Primary Care, COVID-19

Strengths and Limitations

- This study uses multiple data sets to analyse a complex multidisciplinary cancer pathway. Due to data limitations, we innovate in drawing from different data sets to analyse the impact of the pandemic on each stage of the route to diagnosis.
- We use an extremely rich primary care data set containing patient level primary care activity linked to patients' local area socioeconomic indicator.
- Our relatively small (500,000) patient sample is collected from a nationally representative sample of primary care registered patients. The data produces results that closely mirror the rates of consultation and urgent cancer referral per patient (and their reduction) produced in publicly available national data sets.

INTRODUCTION

The COVID-19 pandemic has had a profound impact on UK's health system. Each part of the UK's National Health Service has been impacted in different ways, and we are still feeling many of the consequences of both the COVID-19 pandemic and the public health measures put in place to manage it (non-pharmaceutical interventions; NPI). Cancer is one of the most complicated diseases that the UK health system must manage, being responsible for over one in four UK deaths in 2019. Cancer outcomes are acutely sensitive to changes in social determinants, patient pathways and service provision. Delays in both diagnosis and treatment have significant impacts on patient outcomes(1,2). Pandemic related diagnostic delays, lack of capacity and downstream stage progression (to more advanced disease) are already being seen(3). In addition, the impact of the pandemic needs to be seen in the context of an already overstretched UK cancer care system pre-pandemic that was 'burning hot' even in normal times(4).

Primary care sits at the heart of the cancer patient pathway and is the most crucial interface for early diagnosis and referral to hospital-based care, in addition to their wider support of cancer patient undergoing and post treatment. As models of cancer care have evolved in light of both technical advances and an ageing co-morbid population primary care has become an increasingly important aspect of integrated cancer care and an expansion of GP roles in cancer care(5). On average 22.5% of patients diagnosed with cancer come via primary care, but this reflects wide site-specific variation from as little as 8.3% of breast cancer to 42% for bladder cancer(6) (Data table presented in Annex 1).

It is important to reflect that prior to the start of the COVID-19 pandemic primary care had seen significant declines in overall resourcing relative to the funding of the rest of the NHS and compared to growing levels of disease burden that is managed in primary care. In addition, there is growing evidence that primary care has been under greater pressure in more deprived areas, with higher levels of staff turnover(7), higher levels of complex multimorbidity(8), higher numbers of consultations(9) and lower levels of funding and fewer GPs per capita once levels of ill health are taken into account(10). These pressures on primary care, and a desire to correct them, have been recognised in the NHS Long Term Plan(11).

Thus, to understand the COVID-19's impact on primary care and the downstream impact on cancer outcomes we need to see that the pandemic arrived when the system that was already struggling to cope. Prior to COVID-19, the central role of primary care as agents of change in reducing inequalities had been the subject of much debate yet could do little in the face of political avoidance of health equity(12). Primary care had become a mirror on inequalities but also subject to significant pressures from these growing inequalities that had put practices in deprived populations under significant stress. Yet despite this, equity-oriented primary care reform in England in the mid-to-late 2000s may have helped to reduce socioeconomic inequality in health(13).

[Box]

COVID-19 was officially declared a pandemic by the WHO on 11 March 2020, and the UK announced its first full lockdown on 23rd March. In the following months UK NPI were eased, schools reopened in phases, non-essential shops reopened and in August the population were encouraged to eat out. Some restrictions were re-imposed in September and October, on the 5th of November 2020 a second brief national lockdown lasted until 2nd December. On the 6th of January a third national lockdown was introduced(14).

[End box]

It is now clear that the UK experience of the pandemic was one of the worst in the world, both in terms of excess mortality (both COVID-19 and non-COVID-19) and the impact of NPI (lockdowns) on both the ability of health services to continue provide care and the impact of messaging (stay at home) on patients' timely presentation for care(15). However, the overwhelming focus of impact studies on cancer care has been on hospital-based services, including diagnostics. Given primary care's central role in pathways to diagnosis and integrated cancer care, including survivorship there has been little insight around how overall changes in consultation rates impacted both routine and two week wait referrals as well as how this varied both in terms of site-specific cancers and as a consequence of socio-economic

1 inequalities. In this study we provide the first detailed analysis of primary care activity in relation to cancer patients
2 during the pandemic with a particular focus on inequalities.

3 **METHODS**

4 **Study design, data sources and participants**

5 We perform a population-based cohort study using the following three separate sources.

6 *Primary care data – CPRD Aurum*

7 Primary care electronic health records were obtained from the Clinical Practice Research Datalink (CPRD) database. We
8 included patient records from 01/01/2016 to 31/01/2021. Pre-pandemic data were included to establish long-term
9 trends and patterns of seasonality in primary care use and referrals to secondary care. Similar to recent analysis of the
10 covid pandemic(16), our analysis focusses on comparing observed levels of activity to the expected from March 2020.

11 The CPRD Aurum database contains anonymised patient data from approximately 7% of the UK population and is
12 broadly representative in terms of age, sex, and ethnicity(17).

13 The period of eligibility for study inclusion, which starts on the latest of the study start date (01/01/2016) or the
14 patient's registration to their practice. A patient's period of eligibility ends on the earliest of leaving their practice, the
15 end of data collection from their practice or their death. Primary care records from CPRD were linked to the deciled
16 index of multiple deprivation (IMD) from 2015(18) of each patient's lower super output area (LSOA). 500,000 patients
17 were randomly sampled from the CPRD population who were eligible for linkage within the defined study period. The
18 patient records include information on consultations, patient demographic information, diagnoses, medication
19 prescriptions, and referrals to secondary care.

20 *Cancer wait times data*

21 Cancer waiting times (CWT) measure performance against the NHS Constitution Standards, as well as a number of other
22 metrics. These measures are used by local and national organisations to monitor the timely delivery of services to
23 patients, they are published quarterly by NHS Digitalⁱⁱ.

24 *Cancer diagnosis by socioeconomic status - NCRAS Cancer data equity pack*

25 Data on cancer diagnosis by socioeconomic group was drawn from CADEAS and NCRAS which have two equity data
26 packs presenting the latest national data on the number of urgent suspected two-week wait referrals and first definitive
27 treatments for cancer(19). These data packs are produced based on the CWT data, with analysis from Hospital Episode
28 Statistics (HES) and other sources outlined in their technical notes.

29 **Outcomes**

30 *CPRD Aurum*

31 We define consultations in CPRD data by a set of rules developed based on two variables in the consultations fileⁱⁱⁱ
32 ("EMIS® consultation source identifier" and "Consultation source code identifier"), combined with the type of staff that
33 filled in the record. This method is an adaptation of the approach taken by Carey et al 2012 for CPRD Gold data (Annex
34 2).

35 Using the observation file in CPRD Aurum, we were also able to identify where patients had influenza vaccinations. We
36 look to exclude flu vaccines from our analysis on the basis that the programme was expanded in 2020/21 to achieve

37 ⁱ <https://www.gov.uk/government/statistics/english-indices-of-deprivation-2015>

38 ⁱⁱ <https://www.england.nhs.uk/statistics/statistical-work-areas/cancer-waiting-times/>

39 ⁱⁱⁱ <https://cprd.com/primary-care>

1 maximum uptake^{iv}. To help with the comparability of consultations in the two periods, we removed primary care
2 appointments that included a flu vaccine.

3 We were able to identify vaccinations in CPRD Aurum which identifies observations related to vaccination. We then
4 performed a string search for influenza, including notes that clearly referred to a health care professional administering
5 a vaccine. A list of excluded terms is presented in Annex 3 with a summary of consultations including and excluding
6 influenza vaccinations.
7

8 Referrals in CPRD are categorized into routine and “urgent cancer”. Referrals from the ‘referral file’ are linked to
9 patients, no additional data cleaning steps were taken in the analysis of referrals.
10

11 *Cancer Wait Times*

12 The CWT data present monthly counts of patients who have been recorded as having been through each stage of the
13 cancer diagnosis pathway that is held to a performance target (Annex 4).
14

15 We include in our analysis: the number of patients that receive a first appointment following an urgent referral, the total
16 number of patients receiving first treatments following a cancer diagnosis and the number of patients receiving first
17 treatments following an urgent cancer referral from primary care.
18
19
20

21 *Cancer diagnosis by socioeconomic status - NCRAS Cancer data equity pack*

22 The data show monthly counts, from January 2018 to January 2021 inclusive, broken down by tumour type and patient
23 factors: deprivation, age, sex and ethnicity. The analysis presents the working day adjusted proportion compared to pre-
24 pandemic levels.
25
26

27 **Patient and public involvement**

28 No patient involved
29
30

31 **Data analysis**

32 *CPRD & CWT*

33 For both our primary care data and the CWT data we perform a linear regression of each outcome over time to estimate
34 expected values for the post-pandemic period (end of March 2020 to end of January 2021), based on predicted values
35 from the data pre pandemic:
36
37
38

- 39 - in the case of CPRD Aurum outcomes this is weekly data from 01 January 2016 to 15 March 2020,
- 40 - for CWT outcomes this is monthly data from October 2009 to March 2020.
41

42 To account for seasonality and time trends we include months as a categorical variable and time as a continuous
43 variable, the approach taken by Carr et al.(16). In the case of weekly primary care data we observe large dips in activity
44 in weeks that include bank holidays and include a categorical variable on the basis of the number of bank holidays in
45 each week (in the winter holidays in England there is always one week with two bank holidays).
46

47 When analysing primary care consultation rates by socioeconomics we adjust for population age. We do so when
48 calculating the consultation rates by IMD quintile and weighting the sample according to the European Standard
49 Population^v (ESP).
50

51 *NCRAS equity data*

52
53
54

56

57 ^{iv} https://www.england.nhs.uk/wp-content/uploads/2020/05/Letter_AnnualFlu_2020-21_20200805.pdf

58 ^v <https://www.causesofdeath.org/docs/standard.pdf>

1 The analysis presented in the equity data pack compares new instances of first treatments in months during the
2 pandemic (01 April 2020 – 31 Jan 2021) compared with the same months in 2019/20. The analysis includes a 95%
3 confidence interval for the changes, based on rate ratios under an assumption that the population is the same in the
4 pre-COVID-19 baseline and COVID-19 months. This is calculated using the exact method described in Breslow & Day
5 1987, pp 93-95(20). The NCRAS equity data pack shows the high levels of heterogeneity in the impact of the COVID-19
6 pandemic on different tumour locations^{vi}. Our presentation of these data follows the same method but presents the
7 cumulative difference for the period from April 2020 to the end of January compared with the previous 12 months.
8
9

10 RESULTS

11 Overall impact of the pandemic

12 Before the COVID-19 pandemic and the associated NPI, there was an average of 0.086 primary care consultations per
13 person-week (03/03/2020 – 29/02/2020). This equates to 254 million appointments in primary care nationally. Primary
14 care consultations (Figure 1 a) dropped rapidly to a low of 0.062 appointments per person-week in the week following
15 29/03/2020, this was 66.2% lower than the predicted rate. Rates slowly recovered over the next 22 weeks and by the
16 31/08/2020 were up to 99% of the baseline. In total there were 18.7 million fewer primary care consultations in the
17 English NHS during this period. Primary care consultations again fell to below 90% of predicted levels in the third wave
18 NPI starting on 06/01/2021, by the end of that month there were a further 8.2 million fewer consultations than
19 expected. Between the start of the first NPI in March 2020 and the end of January 2021 there were 27.0 million fewer
20 appointments than expected.
21
22

23 In the year prior to the pandemic, the average rate of urgent cancer (two week wait) referral was 0.00073 per person
24 per week, equating to an estimated 2.1 million for the NHS in England (March 2019 to March 2020). Following the first
25 NPI, urgent cancer referrals from primary care (Figure 1 b) fell to a nadir of 0.00023 by 29/03/2020 (29.7% of the
26 predicted level). Urgent cancer referrals did not return to pre-pandemic baseline until the week following 23/08/2020
27 equating to 303,016 estimated lost urgent cancer referrals over this period. There was a second fall in urgent cancer
28 referrals from primary care in the winter to below 90% of the baseline following the third lockdown (around 0.00065
29 referrals per person-week). This resulted in a further estimated 91,705 fewer urgent cancer referrals than expected.
30 Between the start of the first NPI in March 2020 and the end of January 2021 there were 394,721 fewer urgent cancer
31 referrals than expected.
32
33

34 Routine referrals however have shown a different trajectory in that their rates did not recover to pre-pandemic levels
35 (Figure 1 c). As a share of predicted levels routine referrals had the greatest fall, dropping to around 16%
36 of predicted rates for three weeks from the 05/04/2020. From then to the end of January the closest it came to
37 predicted levels was 80.3% in the week flowing 13/09/2020. In January 2021 it had fallen back down to 60-70% of
38 predicted rates. In the year before March 2020 there were an average of 0.0042 routine referrals per person-week from
39 primary care, equivalent to an estimated 12.2 million for the NHS in England. Between the start of the first NPI in March
40 2020 and the end of January 2021 there were 4.3 million fewer routine referrals than expected.

53
54
55

56 ^{vi} The NCRAS data equity pack is different in its count and analysis of “all tumours” compared with the Cancer Wait Times Data, this
57 is because the data are slightly different (cleaned and analysed by NCRAS). Results of our analysis with each data set are compared
58 in Annex 7.
59

Table 1a: Observed post COVID-19 primary care activity (CPRD Aurum) 15 March 2020 – 30 January 2021

	Observed rate	Expected rate	Percentage reduction (95% CI)	Estimated # missing from England population, n
Event rate per 100,000 person months				
Consultations excl flu vaccinations	31,996	36,517	12.4% (12.3, 12.6)	26,887,014
Routine Referrals	1,046	1,772	41.1% (40.4, 41.8)	4,317,710
2 Week Wait Referrals	268.0	335.8	20.2% (18.1, 22.3)	394,721

Table 1b: Observed post COVID-19 cancer diagnostic activity (Cancer Wait Times), 01 April 2020 - 31 January 2021

	Observed rate	Expected rate	Percentage reduction (95% CI)	Estimated # missing from England population, n
Event rate per 100,000 person months				
First consultant appointments following urgent referral from primary care	296.0	366.4	19.2% (19.1, 19.3)	398,192
Incidence rate per 100,000 person months				
First treatments for new cancer from the urgent primary care referral pathway	21.4	25.5	16.1% (15.5, 16.8)	23,270
First treatments for new cancer from the national screening pathway	1.6	3.5	53.2% (52.0, 54.3)	10,444
First treatments for new cancer	39.7	47.4	16.3% (15.9, 16.6)	43,623

Table 1a summarises the missing appointments and referrals for the post-pandemic period. Since the start of the pandemic in March we have observed consultations rates (excluding flu vaccine appointments) that are 12.4% (C.I. 12.3%, 12.6%) lower than predicted by previous data: equivalent to 27 million appointments when adjusted to match the whole England population between 02/03/2020 and 30/01/2021. The number of referrals to secondary care per consultation has also fallen, with urgent cancer referrals 20.2% (C.I. 18.1%, 22.3%) and routine referrals 41.1% (C.I. 40.4%, 41.8%) lower than expected: this is an estimated 394,721 and 4.3 million missing urgent cancer and routine referrals respectively.

The knock-on effect of the reductions in patients' primary care appointments and referrals can be observed in the national CWT data. The number of first appointments with a cancer specialist following an urgent cancer referral has fallen by approximately the same amount as estimated for the referrals themselves: 19.2% (C.I. 19.1%, 19.3%). The number of cancer first treatments (following a diagnosis and decision to treat) was 16.3% (C.I. 15.9%, 16.6%) lower than expected, or 43,623 missing first treatments from 01/04/2020 - 31/01/2021^{vii} (graphs of observed compared with expected are presented in Annex 6).

Urgent cancer referrals by site specific cancer from 01/04/2020 until 31/01/2021 showed significant heterogeneity from moderate reductions in urgent referrals for suspected breast (7.0% C.I. 6.6%, 7.5%) and gynaecological cancers (10.3% C.I. 9.7%, 10.9%), to 36.9% (C.I. 36.1%, 37.8%) and 27.2% (C.I. 26.7%, 27.7%) reduction in urgent referrals for lung and urological cancers, respectively (Figure 2). To show how pathway delays interface with reductions in cancer referrals we also examined reductions in first treatments for the same site-specific cancers over this period (Figure 2). Breast and urological cancers observed the greatest reduction in new first treatments: Breast fell by 24.8% (C.I. 23.6%, 25.9%) which equates to 10,042 missing treatments and urological by 24.1% (C.I. 23.2%, 25.2%) which equates to 12,086 missing treatments. Taken together these data reflect substantial delays in both diagnostic and treatment phases of the patient pathway.

^{vii} Dates for the CWT and NCRAS analysis do not line up with the CPRD analysis because the latter is conducted weekly, not monthly.

Inequalities in cancer diagnosis outcomes in the pandemic

There are inequalities in primary care use in England, with the people who live in the poorest areas have higher rates of consultation than those in richer areas once we adjust for age. The most deprived quintile was expected to have 41,702 consultations per 100,000 person-months, 15% more than the least deprived.

Table 2: Observed post COVID-19 primary care activity (CPRD Aurum) by IMD quintile, actual and age-standardised

	22 Mar 2020 - 30 Jan 2021 (Weekly)		
	Observed rate	Expected rate	Percentage reduction (95% CI)
Consultations per 100,000 person-months			
IMD Quintile - 1 (least deprived)	32,015	37,030	13.5% (13.2, 13.9)
IMD Quintile - 2	32,490	37,308	12.9% (12.6, 13.3)
IMD Quintile - 3	33,479	38,707	13.5% (13.2, 13.9)
IMD Quintile - 4	32,143	36,573	12.1% (11.8, 12.5)
IMD Quintile - 5 (most deprived)	33,361	37,062	10.0% (9.6, 10.3)
Consultations per 100,000 person-months (Age-standardised*)			
IMD Quintile - 1 (least deprived)	31,216	36,141	13.6% (13.3, 14.0)
IMD Quintile - 2	32,244	37,160	13.2% (12.9, 13.6)
IMD Quintile - 3	33,886	39,382	14% (13.6, 14.3)
IMD Quintile - 4	34,683	39,677	12.6% (12.3, 12.9)
IMD Quintile - 5 (most deprived)	37,487	41,702	10.1% (9.8, 10.4)

*Age-standardisation is performed according to the European Standard Population (ESP)

The reduction of consultations over the period 22/03/2020-30/01/2021 was smallest for those in most deprived areas. Their reduction in consultations for the non-age-standardised figures was 10.0% (C.I. 9.6%, 10.3%), while for the least deprived the reduction was 13.5% (C.I. 13.2%, 13.9%). Weekly levels of age-standardised consultations per person-week by IMD quintile are presented in Annex 8.

Despite a smaller reduction in primary care contacts, we observe the largest reduction in both urgent cancer referrals and first treatments for cancer for patients living in the most deprived areas. The NCRAS data equity pack presents the number of urgent cancer referrals and first cancer treatments by IMD quintile^{viii}. Figure 3 shows the reduction in urgent cancer referrals and first treatments for newly diagnosed cancer by IMD quintile.

There was a greater percentage reduction in urgent cancer referrals for those living in the most deprived areas in England experienced a 17.6% (C.I. 17.2%, 18.0%) reduction between 01/03/2020 and 31/01/2021 compared with the same period 12 months before, while referrals for the least deprived quintile fell by proportionately less: 15.3% (C.I. 14.9%, 15.6%). This equates to a reduction of 61,469 referrals for the most deprived and 62,601 or the least: without adjusting for age, the most deprived quintile had a smaller proportion of the pre-pandemic urgent cancer referrals, with 349,640 referrals compared to 410,293 for the least deprived quintile from April 2019 to January 2020.

At the same time, rates of new treatment for cancer for the people living in the most deprived 20% of England experienced a 15.8% (C.I. 14.6%, 17.0%) reduction between 01/03/2020 and 31/01/2021 compared with the same

^{viii} They do not age-standardise their results

1 period 12 months before (6,607 missing first treatments). The reduction for the least deprived was 12.6% (C.I. 11.5%,
2 13.7%) which equates to 6,880 missing first treatments.

3 Despite having more access to primary care for patients in more deprived areas (10.1% reduction for most deprived
4 compared to 13.6% for the least deprived), urgent cancer referrals and newly diagnosed cancers have been disrupted by
5 the pandemic more for people living in poorer areas.
6

7 **DISCUSSION**

8
9 The coronavirus SARS-CoV-2 (COVID-19) pandemic has had a profound impact on the management of patients with
10 cancer(21). The first national lockdown in March 2020 created a ripple of non-pharmaceutical interventions, including
11 'stay at home' orders, diminished healthcare service provision and redistribution of healthcare to COVID-19 related care
12 that has had a profound impact on cancer services(1,22). Whilst it was already known that there had been a substantial
13 reduction in the number of overall cancer-related referrals(23,24) the quantification of this had been missing. Our
14 findings, that primary care consultations in English NHS fell by 12.4% between January 2020 and January 2021 with
15 urgent cancer referrals even more suppressed (20.2%), reflect how profound the pathway disruptions were for cancer
16 patients. Furthermore, many cancers are picked up through the course of routine referrals from general practice for
17 non-specific symptoms. The drop in routine referrals that we found - 4.3 million – over this period will inevitably
18 translate into late-stage presentation and a substantial reduction in outcomes. This will include wider economic costs
19 due to more expensive (late stage) treatment and productivity losses due to morbidity and premature mortality.
20 However, the trajectory of the declines reflect not just changes to national policy in terms of NPI, but also knock-on
21 effects around public behaviour, primary care staffing, downstream reductions in diagnostics and an overall increase in
22 friction across all cancer pathways and systems.
23

24 This reduction in cancer pathways through primary care needs to be put in the context of wider disruptions. The
25 suspension of national cancer screening programmes meant that circa 2 million people were not screened for cancer
26 through national programs(26,27). Moreover, delays in cancer diagnoses and treatments have consistently been
27 associated with poorer outcomes(1,2). The COVID-19 pandemic has also exacerbated the worst 62-day cancer waiting
28 time targets in the last decade where 1 of 4 patients urgently referred from primary care between April 2020 and
29 January 2021 did not receive treatment within 62 days(24).
30

31 In our analysis of urgent cancer referrals by site in relation to reductions seen in first treatments significant differences
32 were seen. Urological cancers (testis, renal and urothelial) have been particularly impacted with greater than 25%
33 decrease both in urgent referrals and first treatments. This suggests that outcomes will be particularly impacted in this
34 group. Lung, skin and lower GI (colon and rectal) also experienced significant declines in urgent referrals. Breast cancer
35 was the least impacted of all in terms of urgent referrals, but experienced a 25% reduction in first treatments, indicating
36 that cancer's reliance on screening programmes, which have suffered yet more than urgent referrals as a result of the
37 pandemic(24). Although it is likely that some cancer patients have already been 'lost' to the system i.e. died of COVID-
38 19 or other non-COVID19 comorbidities, a significant number will now present with later stage disease.
39

40 Our findings also reflect socioeconomic inequalities with more profound decrease in urgent cancer referrals and first
41 treatments for the most deprived populations, despite relatively better preservation of consultation rates. This is
42 unexpected and extremely worrying, indicating greater disruption to the diagnostic pathway for patients living in more
43 deprived areas, whose cancer outcomes were typically worse than their less deprived counterparts pre-
44 pandemic(28,29).
45

46 **Limitations**

47 This study uses multiple data sets to analyse a complex and disjointed pathway. We include a primary care data set that
48 uses a relatively small (500,000) patient sample. However, the CPRD data produces results that closely mirror the rates
49 of consultation per patient (and their reduction) produced in NHS Digital's appointments data(25). In addition, the
50 estimated reduction in urgent cancer referrals is close to those presented in the NCRAS's analysis of their cancer registry
51

1 data (Table 1). It is not yet possible to link these data on a patient basis due to delays in data access and once possible
2 further research would be illuminating.

Conclusions

Our data reflects a disruption to a complex interaction of several systemic issues that place a great deal of impetus on the role of primary care in ensuring early diagnosis of cancer. Primary care were under strain pre-pandemic, with low levels of investment creating problems(30). Particularly areas of high deprivation general practice is under-funded and under-doctored relative to need(7,8,10).

Early cancer diagnosis requires concordance of each participant and mechanism - including patients' awareness and ability to present with cancer symptoms, the ability of GPs to detect and urgently refer possible cancer cases and sufficient diagnostic capacity (in terms of both workforce and equipment) to enable swift referrals and minimise delays to diagnosis and treatment.

Every one of these nodes on the pathway to early diagnosis has been affected by the pandemic and the government response. There are also new potential barriers to the pathway that have resulted, including decreases in health seeking behaviour, many appointments being conducted remotely, changes in routine referral guidelines, changes in the capacity of acute care. However, further work is required as there is currently little understanding and even less evidence about how much each disruption is ultimately impacting cancer pathways.

The impact of the pandemic on cancer shown here is concerning. However, what is more concerning is the unequal and inequitable impact on those worst off. Cancer as a disease area "*magnifies what we know to be true about the totality of the health care system. It exposes all its strengths and weaknesses*"(31). Our results further evidence the strain on primary care and the presence of the inverse care law(32), and the dire need to address the inequalities so sharply brought into focus by the pandemic. We need to address the disconnect between the importance we place on the role of primary care and the resources we devote to it.

Key messages

- Primary care is key part of the pathway for early cancer diagnosis through both routine and 2ww referrals
- Cancer diagnosis rates have experienced a sustained fall since the start of the COVID-19 pandemic and introduction of non-pharmaceutical interventions (NPIs) 'lockdowns'.
- The fall in urgent cancer referral is larger than the fall in primary care contacts, implying that the content of consultations has shifted away from potential cancer diagnosis.
- Despite having a smaller reduction in primary care contact through the pandemic, patients living in poorer areas have had larger reductions in urgent cancer referrals and first treatments for new cancer.
- Government, patients and primary care staff must work together to catch up on missing diagnosis.
- Resilience in primary care is key for the cancer diagnosis pathway and must be developed for future disruptions, particularly in poorer areas where care is more complex.

Annex 2: Consultation definition

CPRD Aurum data dictionary sets out the structure of the data. Within the consultation file there are two variables one can use to identify whether a primary care contact, rather than an administrative note ("EMIS® consultation source identifier" and "Consultation source code identifier").

The EMIS consultation source identifier is the primary variable used. We include the following observations of this variable:

Acute visit, Casualty attendance, Clinic, Emergency appointment, Emergency consultation, Enterprise consultation, Face to face consultation, Follow-up/routine visit, Gp surgery, Home visit, Home visit note, Main surgery, Nursing home, Nursing home visit note, Online services message, Other, Residential home, Residential home visit note, Same day appointment, Surgery consultation, Telephone encounter, Urgent consultation, Walk-in centre, Walk-in clinic

We also include instances where EMIS consultation source identifier is "awaiting review" and the Consultation source code identifier is in the following list:

1
2
3 Consultation, visit, seen in gp unit, seen in private clinic, seen in rapid access clinic at gp surgery, seen in urgent care centre, online
4 communication.
5

6 We then further exclude records on the basis of the category of staff responsible for the record. The “[Job category](#)” variable from
7 the staff file, linked by the consultation id is used. We only include as a consultation records filled out by GPs, doctors, nurses and
8 other health care professionals as defined in CPRD’s numerical codes listed below:
9

10 GP – 4, 5, 15, 24, 31, 181, 183

11 Dr – 1, 41, 91, 116, 119, 121, 126, 173, 177, 197

12 Nurse – 8, 9, 27, 33, 47, 48, 50, 55, 59, 60, 61, 111

13 Other healthcare professional - 2, 3, 6, 7, 10:14, 16, 17, 34:37, 42, 43, 52, 54, 58, 62:65, 68, 72, 73, 77, 80, 82, 83, 86:89, 94, 95, 97,
14 100:102, 105, 106, 112:114, 118, 122, 125, 127, 131, 135, 136, 138, 141, 142, 145, 148, 149, 154, 156, 158, 168, 185, 186, 188, 189,
15 204, 208
16
17

18 In Table A2.1 we present the CPRD Aurum Staff Category list.
19

20 In Table A2.2 we present the total number of consultations identified from 01 January 2016 to 31 January 2021, the count with each
21 combination of staff category, “EMIS® consultation source identifier” and “Consultation source code identifier” in table y we show
22 the count of records that were excluded, highlighting those that were excluded on the basis of staff category, not the consultation
23 file description variables.

Annex 3: a list of terms excluded to help identify true vaccinations in the data

Figure A3.1 Consultation rates including and excluding influenza vaccine in CPRD Aurum data, 01 Jan 2019 – 30 Jan 2021

A list of terms excluded to help identify flu vaccinations in the data

We excluded observations in the data that the data provider identified as relating to vaccines. We then searched for the words flu and influenza in the medical term and excluded those that also contained the following words:

Letter, decline, consent, needs, request, missed, invite, needed, required, status, immunity, immune, advised, due, contact tracing, required, education, booked, up to date, did not attend, contraindicated, not indicated, invitation, history of, can be, indication, has flu vaccination at, reason for, other healthcare provider, given by pharmacist, recommend.

Annex 4: NHS targets for cancer wait times

		Operational standard	
Maximum two weeks from	Receipt of urgent referral for suspected cancer to first outpatient attendance	93%	
	Receipt of referral of any patient with breast symptoms (where cancer not suspected) to first hospital assessment	93%	
Maximum 28 days from	Receipt of two week wait referral for suspected cancer, receipt of urgent referral from a cancer screening programme (breast, bowel, cervical), and receipt of two week wait referral of any patient with breast symptoms (where cancer not suspected), to the date the patient is informed of a diagnosis or ruling out of cancer	75%	
Maximum one month (31 days) from:	Decision to treat to first definitive treatment	96%	
	Decision to treat/earliest clinically appropriate date to start of second or subsequent treatment(s) for all cancer patients including those diagnosed with a recurrence where the subsequent treatment is:	surgery	94%
		drug treatment	98%
		radiotherapy	94%
Maximum two months (62 days) from:	Urgent referral for suspected cancer to first treatment (62-day classic)	85%	
	Urgent referral from a NHS Cancer Screening Programme (breast, cervical or bowel) for suspected cancer to first treatment	90%	

Annex 5: Patient demographics and person-time and total numbers of observed activity in CPRD Aurum sample

Table A5.1: Patient demographics in CPRD Aurum sample as at 22 March 2020

	Patient count as at 22 March 2020	
	n	%

*The pre-pandemic period consists of 220 weeks and 51.61 months, the post pandemic period is 45 weeks and 10.26 months

Annex 6: Observed vs expected appointment and cancer diagnosis counts from CWT data from 01 Jan 2019 (per person-month)

Annex 7: Comparing Cancer Wait Times counts for referrals and first treatments with the NCRAS data equity pack

CADEAS and NCRAS have produced two equity data packs presenting the latest national data on the number of urgent suspected two-week wait referrals and first definitive treatments for cancer. These data packs are produced on the basis of the Cancer Wait Times data, with analysis from Hospital Episode Statistics (HES) and other sources outlined in their technical notes.

“Any differences between treatment volumes in the published official statistics and the volumes presented in this pack are because:

- Data was extracted from the CWT system at a slightly different time.
- Data included here is based on England residents only.

Additional logic has been applied to remove treatments where some of the information required for this equity analysis is missing or there are potential data quality issues, for example cases with a mismatch between the suspected cancer referral type and sex (eg. gynaecological cancer treatments for men, testicular cancer treatments for women), and suspected cancer referral type and age (eg. suspected children's cancer for patients aged 20 and over).” – NCRAS Cancer data equity pack technical notes. Available: http://www.ncin.org.uk/local_cancer_intelligence/cadeas

Peer review only

STROBE Statement—checklist of items that should be included in reports of observational studies

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	3
Objectives	3	State specific objectives, including any prespecified hypotheses	3
Methods			
Study design	4	Present key elements of study design early in the paper	4
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	4
Participants	6	(a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants	4
		(b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case	
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	4/5
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	4/5
Bias	9	Describe any efforts to address potential sources of bias	5/6
Study size	10	Explain how the study size was arrived at	4
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	4-6
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	5/6
		(b) Describe any methods used to examine subgroups and interactions	5/6
		(c) Explain how missing data were addressed	4-6
		(d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy	N/A
		(e) Describe any sensitivity analyses	4-6

Continued on next page

Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	4/5
		(b) Give reasons for non-participation at each stage	N/A
		(c) Consider use of a flow diagram	N/A
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	6-8
		(b) Indicate number of participants with missing data for each variable of interest	6-8
		(c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount)	N/A
Outcome data	15*	<i>Cohort study</i> —Report numbers of outcome events or summary measures over time	6/7
		<i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure	N/A
		<i>Cross-sectional study</i> —Report numbers of outcome events or summary measures	N/A
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	6-8
		(b) Report category boundaries when continuous variables were categorized	N/A
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	N/A
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	6-8
Discussion			
Key results	18	Summarise key results with reference to study objectives	9
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	9/10
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	10
Generalisability	21	Discuss the generalisability (external validity) of the study results	9/10
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	1

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.

Abstract

Objectives

We explore the routes to cancer diagnosis to further understanding of the inequality in the reduction in detection of new cancers since the start of the pandemic. We use different data sets to assess stages in the cancer pathway: primary care data for primary care consultations, routine and urgent referrals and published analysis of cancer registry data for appointments and first treatments.

Setting

Primary and cancer care

Participants

In this study we combine multiple data sets to perform a population-based cohort study on different areas of the cancer pathway. For primary care analysis, we use a random sample of 500,000 patients from the Clinical Practice Research Datalink (CPRD). Post-referral we perform a secondary data analysis on the Cancer Wait Times data and the National Cancer Registry Analysis Service (NCRAS) COVID-19 data equity pack.

Outcome measures:

Primary care: consultation, urgent cancer referral and routine referral rates, then appointments following an urgent cancer referral, and first treatments for new cancer, for all and by quintile of patient's local area Index of Multiple Deprivation.

Results

Primary care contacts and urgent cancer referrals fell by 12.4% (12.3 to 12.6; 95% CI) and 20.2% (18.1 to 22.3; 95% CI) respectively, while routine referrals have not recovered to pre-pandemic levels. Reductions in first treatments for newly diagnosed cancers are down 16.3% (15.9 to 16.6; 95% CI). The reduction in the number of two week wait referrals and first treatments for all cancer has been largest for those living in poorer areas, despite having a smaller reduction in primary care contact.

Conclusions

Our results further evidence the strain on primary care and the presence of the inverse care law, and the dire need to address the inequalities so sharply brought into focus by the pandemic. We need to address the disconnect between the importance we place on the role of primary care and the resources we devote to it.

Key Words: Oncology, Primary Care, COVID-19

Strengths and Limitations

- This study draws from multiple data sets along the complex, multidisciplinary cancer pathway.
- We use a rich primary care data set containing patient level primary care activity linked to patients' local area socioeconomic indicator.
- Our primary care patient sample is relatively small (500,000 active patients from January 2016 to January 2021), however the data produces results that closely mirror the rates of consultation and urgent cancer referral per patient produced in publicly available national data sets.

INTRODUCTION

The COVID-19 pandemic has had a profound impact on UK's health system. Each part of the UK's National Health Service has been impacted in different ways, and we are still feeling many of the consequences of both the COVID-19 pandemic and the public health measures put in place to manage it (non-pharmaceutical interventions; NPI). Cancer is one of the most complicated diseases that the UK health system must manage, being responsible for over one in four UK deaths in 2019. Cancer outcomes are acutely sensitive to changes in social determinants, patient pathways and service provision. Delays in both diagnosis and treatment have significant impacts on patient outcomes(1,2). Pandemic related diagnostic delays, lack of capacity and downstream stage progression (to more advanced disease) are already being seen(3). In addition, the impact of the pandemic needs to be seen in the context of an already overstretched UK cancer care system pre-pandemic that was 'burning hot' even in normal times(4).

Primary care sits at the heart of the cancer patient pathway and is the most crucial interface for early diagnosis and referral to hospital-based care, in addition to their wider support of cancer patient undergoing and post treatment. As models of cancer care have evolved in light of both technical advances and an ageing co-morbid population primary care has become an increasingly important aspect of integrated cancer care and an expansion of General Practitioner (GP) roles in cancer care(5). On average 22.5% of patients diagnosed with cancer are referred to oncology diagnostic services from primary care, but this reflects wide site-specific variation from as little as 8.3% of breast cancer to 42% for bladder cancer(6).

It is important to reflect that prior to the start of the COVID-19 pandemic primary care had seen significant declines in overall resourcing relative to the funding of the rest of the NHS and compared to growing levels of disease burden that is managed in primary care. In addition, there is growing evidence that primary care has been under greater pressure in more deprived areas, with higher levels of staff turnover(7), higher levels of complex multimorbidity(8), higher numbers of consultations(9) and lower levels of funding and fewer GPs per capita once levels of ill health are taken into account(10). These pressures on primary care, and a desire to correct them, have been recognised in the NHS Long Term Plan(11).

Thus, to understand the COVID-19's impact on primary care and the downstream impact on cancer outcomes we need to see that the pandemic arrived when the system that was already struggling to cope. Prior to COVID-19, the central role of primary care as agents of change in reducing inequalities had been the subject of much debate yet could do little in the face of political avoidance of health equity(12). Primary care had become a mirror on inequalities but also subject to significant pressures from these growing inequalities that had put practices in deprived populations under significant stress. Yet despite this, equity-oriented primary care reform in England in the mid-to-late 2000s may have helped to reduce socioeconomic inequality in health(13).

[Box]

COVID-19 was officially declared a pandemic by the WHO on 11 March 2020, and the UK announced its first full lockdown on 23rd March. In the following months UK NPI were eased, schools reopened in phases, non-essential shops reopened and in August the population were encouraged to eat out. Some restrictions were re-imposed in September and October, on the 5th of November 2020 a second brief national lockdown lasted until 2nd December. On the 6th of January a third national lockdown was introduced(14).

[End box]

It is now clear that the UK experience of the pandemic was one of the worst in the world, both in terms of excess mortality (both COVID-19 and non-COVID-19) and the impact of NPI (lockdowns) on both the ability of health services to continue provide care and the impact of messaging (stay at home) on patients' timely presentation for care(15). However, the overwhelming focus of impact studies on cancer care has been on hospital-based services, including diagnostics. Given primary care's central role in pathways to diagnosis and integrated cancer care, including survivorship there has been little insight around how overall changes in consultation rates impacted both routine and two week wait referrals as well as how this varied both in terms of site-specific cancers and as a consequence of socio-economic

inequalities. This study aimed to analyse the socioeconomic inequalities in the impact of NPI measures taken in response to COVID-19 on consultations and routine and urgent cancer referrals in primary care and cancer diagnosis in secondary care.

METHODS

Study design, data sources and participants

We perform a population-based cohort study using the following three separate sources.

Primary care data – CPRD Aurum

Primary care electronic health records were obtained from the Clinical Practice Research Datalink Aurum database (henceforth CPRD). We included patient records from 01 January 2016 to 31 January 2021. Pre-pandemic data were included to establish long-term trends and patterns of seasonality in primary care use and referrals to secondary care. Similar to recent analysis of the COVID-19 pandemic(16), our analysis focusses on comparing observed levels of activity to the expected following the introduction of NPI in England in March 2020.

CPRD contains anonymised patient primary care data from approximately 7% of the UK population and is broadly representative in terms of age, sex, and ethnicity(17). The patient records include information on consultations, patient demographic information, diagnoses, medication prescriptions, and referrals to secondary care.

The period of eligibility for study inclusion, which starts on the latest of the study start date (01/01/2016) or the patient's registration to their practice. A patient's period of eligibility ends on the earliest of leaving their practice, the end of data collection from their practice or their death. Primary care records from CPRD were linked to the deciled index of multiple deprivation (IMD) from 2015ⁱ(18) of each patient's lower layer super output area (LSOAⁱⁱ). 500,000 patients were randomly sampled from the CPRD population in England who were eligible for linkage within the defined study period.

Cancer wait times data

Cancer waiting times (CWT) measure performance against the NHS Constitution Standards, recording the number of patients screened, referred to oncology specialists, diagnosed and treated for cancer. These measures are used by local and national organisations to monitor the timely delivery of services to patients, they are published quarterly by NHS Digitalⁱⁱⁱ.

Cancer diagnosis by socioeconomic status - NCRAS Cancer equity data

Data on cancer diagnosis by socioeconomic group was drawn from CADEAS and National Cancer Registry Analysis Service (NCRAS) which have two published data sets(19), presenting the latest national data on:

- i. The number of urgent suspected two-week wait referrals^{iv} and,
- ii. First definitive treatments for cancer^v.

ⁱ <https://www.gov.uk/government/statistics/english-indices-of-deprivation-2015>

ⁱⁱ Geographic areas in England and Wales that are built from groups of contiguous Output Areas and have been automatically generated to be as consistent in population size as possible, and typically contain from four to six Output Areas. The Minimum population is 1000 and the mean is 1500. For more details visit:

1 These data packs are produced based on the CWT data, with analysis from Hospital Episode Statistics (HES) and other
2 sources outlined in their technical notes (further details in Annex 1).

3 **Study Outcomes**

4 Primary care consultations

5 We define consultations in CPRD data by a set of rules developed based on two variables in the consultations file^{vi}
6 (“EMIS® consultation source identifier” and “Consultation source code identifier”)^{vii}. In line with the approach taken by
7 Carey et al 2012 for CPRD Gold data, we use a combination of the consultation code and the category of the record to
8 identify consultations (details in Annex 2).

9 Using the observation file in CPRD Aurum, we were also able to identify where patients had influenza vaccinations. We
10 look to exclude flu vaccines from our analysis on the basis that the programme was expanded in 2020/21 to achieve
11 maximum uptake^{viii}. To help with the comparability of consultations in the two periods, we removed primary care
12 appointments that included a flu vaccine.

13 Referrals from primary care: routine and urgent cancer

14 Referrals in CPRD are categorized into routine and “urgent cancer”. Referrals from the ‘referral file’ are linked to
15 patients, no additional data cleaning steps were taken in the analysis of referrals.

16 First appointment following an urgent referral

17 The CWT data present monthly counts of patients in England who have been recorded as receiving a first appointment
18 following an urgent referral from primary care. The CWT data record this because the NHS have a 2-week performance
19 target (Annex 3).

20 The NCRAS cancer equity data contain monthly counts in England of appointments following an urgent cancer referral
21 broken down by tumour type and by deprivation according to patient’s place of residence.

22 First treatment following a cancer diagnosis

23 The CWT data present monthly counts of patients in England who have been recorded as receiving a first treatment for a
24 new cancer diagnosis. The CWT data record this because the NHS have a 31-day performance target (Annex 3).

25 The NCRAS cancer equity data contain monthly counts in England of first treatments for new cancer broken down by
26 tumour type and by deprivation according to patient’s place of residence.

27 **Patient and public involvement**

28 No patients involved

29 **Data analysis**

30 CPRD & CWT

31 For both CPRD and CWT we separate the data into two, before and after the introduction of the first NPI.

57 record.

58 ^{viii} https://www.england.nhs.uk/wp-content/uploads/2020/05/Letter_AnnualFlu_2020-21_20200805.pdf

1 Our analysis of CPRD primary care is conducted weekly and split into two periods before and after the introduction of
2 NPI on March 23rd 2020 (pre-NPI data is from 03 January 2016 to 21 March 2020, our post-NPI onset data is 22 March
3 2020 to 30 January 2021).

4 CWT data is reported monthly, our pre-NPI data is therefore from 01 October 2009 to 31 March 2020, our post-NPI
5 onset period is 01 April 2020 to 31 January 2021.

6 We perform a linear regression of consultations, urgent and routine referrals from CPRD data and appointments
7 following an urgent cancer referral and first treatments from CWT data over time to estimate expected values for the
8 post-NPI onset period, based on predicted values from the data pre-NPI. To account for seasonality and time trends we
9 include months as a categorical variable and time as a continuous variable, the approach taken by Carr et al.(16). In the
10 case of weekly primary care data, we observe large dips in activity in weeks that include bank holidays and include a
11 categorical variable on the basis of the number of bank holidays in each week (in the winter holidays in England there is
12 always one week with two bank holidays). Our primary care activity rates are presented per 100,000 patient-months^{ix}.
13 When analysing primary care consultation rates by socioeconomics we adjust for population age. We do so when
14 calculating the consultation rates by IMD quintile and weighting the sample according to the European Standard
15 Population^x (ESP).
16
17
18
19

20 *NCRAS equity data*

21
22 The analysis presented in the equity data pack compares new instances of first treatments in months during the
23 pandemic (01 April 2020 – 31 Jan 2021) compared with the same months in 2019/20. The analysis includes a 95%
24 confidence interval for the changes, based on rate ratios under an assumption that the population is the same in the
25 pre-COVID-19 baseline and COVID-19 months. This is calculated using the exact method described in Breslow & Day
26 1987, pp 93-95(20). The NCRAS equity data pack shows the high levels of heterogeneity in the impact of the COVID-19
27 pandemic on different tumour locations. The NCRAS data equity pack is different in its count and analysis of “all
28 tumours” compared with the Cancer Wait Times Data, this is because the data are slightly different (cleaned and
29 analysed by NCRAS – details in Annex 1). Results of our analysis with each data set are compared in Annex 4. Our
30 presentation of these data follows the same method but presents the cumulative difference for the period from April
31 2020 to the end of January compared with the previous 12 months.
32
33
34

35 **RESULTS**

36 **Overall impact of the pandemic**

37
38 In the calendar year of 2019, before the COVID-19 pandemic and the associated NPI, there was an average of 39,127
39 primary care consultations per 100,000 patient-months. This equates to 4.70 attended appointments per registered
40 patient, or an estimated 266 million appointments in primary care nationally in 2019^{xi}.
41
42

43 Primary care consultations (Figure 1 a) dropped rapidly to a low of 26,919 consultations per 100,000 patient-months in
44 the week following 29 March 2020, this was 66.0% lower than the predicted rate. Rates slowly recovered over the next
45 24 weeks and by 05 September 2020 were up to 99% of the baseline. In total there were an estimated 19.7 million (19.5
46 to 20.0; 95% CI) fewer primary care consultations in the English NHS during this period. Primary care
47 consultations again fell to below 90% of predicted levels in the third wave NPI starting on 06 January 2021, by the end of
48 January 2021 there were a further 6.4 million fewer consultations than expected. Between the start of the first NPI in
49
50
51
52

53
54 ^{ix} We adjust the weekly rates per active patient in our sample to 100,000 patient-months: Weekly rate per registered patient in
55 sample x 100,000 x (52/12)

56 ^x <https://www.causesofdeath.org/docs/standard.pdf>

57 ^{xi} For comparison the NHS national appointments data recorded 272 million attended appointments in primary care in 2019. Found
58 here: <https://digital.nhs.uk/data-and-information/publications/statistical/appointments-in-general-practice/march-2021>

March 2020 and the end of January 2021 there were an estimated 26.1 million (25.7 to 26.5; 95% CI) fewer appointments than expected (Table 1a).

In 2019, the average rate of urgent cancer (two week wait) referral was 314 per 100,000 patient-months, equating to an estimated 2.12 million for the NHS in England. Following the first NPI, urgent cancer referrals from primary care (Figure 1 b) fell to a nadir of 86 per 100,000 patient-months by 29 March 2020 (29.7% of the predicted level). Urgent cancer referrals did not return to pre-pandemic baseline until the week following 23 August 2020 equating to 317,000 (280,000 to 356,000; 95% CI) estimated lost urgent cancer referrals over this period. There was a second fall in urgent cancer referrals from primary care in the winter to below 90% of the baseline following the third lockdown (164 referrals per 100,000 patient-months in the week beginning 27 December 2021). This resulted in a further estimated 91,705 fewer urgent cancer referrals than expected. Between the start of the first NPI in March 2020 and the end of January 2021 there were 395,000 (344,000 to 446,000; 95% CI) fewer urgent cancer referrals than expected (Table 1a).

Routine referrals however have shown a different trajectory in that their rates did not recover to pre-pandemic levels (Figure 1 c). As a share of predicted levels routine referrals had the greatest fall, dropping to 16.1% of predicted rates in the week from 19 April 2020. From then to the end of January the closest it came to predicted levels was 80.3% in the week flowing 13 September 2020. For the four weeks in January 2021, it had fallen back down to 60-70% of predicted rates. In 2019 there were an average of 1,801 routine referrals per 100,000 patient-months from primary care, equivalent to an estimated 12.2 million for the NHS in England. Between the start of the first NPI in March 2020 and the end of January 2021 there were 4.33 million (4.21 to 4.46; 95% CI) fewer routine referrals than expected (Table 1a).

Patient demographics and patient-time and total numbers of observed consultations and routine and urgent referrals in our CPRD sample are presented in Annex 5.

Table 1a: Observed post COVID-19 primary care activity (CPRD Aurum) 22 March 2020 – 30 January 2021

	Observed rate	Expected rate	Percentage reduction (95% CI)	Estimated # missing from England population, to 3 significant digits (95% CI)
Event rate per 100,000 patient-months				
Consultations	34,201	38,684	11.6% (11.4, 11.7)	26,100,000 (25,700,000, 26,500,000)
Routine Referrals	1,067	1,812	41.1% (40.4, 41.8)	4,330,000 (4,210,000, 4,460,000)
2 Week Wait Referrals	268	336	20.2% (18.1, 22.3)	395,000 (344,000, 446,000)

Table 1b: Observed post COVID-19 cancer diagnostic activity (Cancer Wait Times), 01 April 2020 - 31 January 2021

	Observed rate	Expected rate	Percentage reduction (95% CI)	Estimated # missing from England population, to 3 significant digits (95% CI)
Event rate per 100,000 patient-months				
First consultant appointments following urgent referral from primary care	296	366	19.2% (19.1, 19.3)	398,000 (395,000, 401,000)
Incidence rate per 100,000 patient-months				
First treatments for new cancer from the urgent primary care referral pathway	21.4	25.5	16.1% (15.5, 16.8)	23,300 (22,200, 24,400)
First treatments for new cancer from the national screening pathway	1.63	3.47	53.2% (52, 54.3)	10,400 (10,000, 10,900)
First treatments for new cancer	39.7	47.4	16.3% (15.9, 16.6)	43,600 (42,500, 44,700)

Table 1a summarises the missing appointments and referrals for the post-pandemic period. Since the start of the pandemic in March we have observed consultations rates that are 11.6% (11.4 to 11.7; 95% CI) lower than predicted by previous data. The number of referrals to secondary care per consultation has also fallen, with urgent cancer referrals 20.2% (18.1 to 22.3; 95% CI) and routine referrals 41.1% (40.4 to 41.8; 95% CI) lower than expected.

The knock-on effect of the reductions in patients' primary care appointments and referrals can be observed in the national CWT data. The number of first appointments with a cancer specialist following an urgent cancer referral has fallen by approximately the same amount as estimated for the referrals themselves: 19.2% (19.1 to 19.3; 95% CI). The number of cancer first treatments (following a diagnosis and decision to treat) was 16.3% (15.9 to 16.6; 95% CI) lower than expected, or 43,600 (42,500 to 44,700; 95% CI) missing first treatments from 01 April 2020 - 31 January 2021^{xii} (graphs of observed compared with expected are presented in Annex 6).

Urgent cancer referrals by site specific cancer from 01 April 2020 until 31 January 2021 showed significant heterogeneity from moderate reductions in urgent referrals for suspected breast (7.0%; 95% CI 6.6 to 7.5) and gynaecological cancers (10.3%; 95% CI 9.7 to 10.9) and greater reductions for lung (36.9%; 95% CI 36.1 to 37.8) and urological (27.2%; 95% CI 26.7 to 27.7) cancers (Figure 2, further details in Annex 4, Table A4.1). To show how pathway delays interface with reductions in cancer referrals we also examined reductions in first treatments for the same site-specific cancers over this period (Figure 2). Breast and urological cancers observed the greatest reduction in new first treatments: Breast fell by 24.8% (23.6 to 25.9; 95% CI) which equates to 10,000 missing treatments and urological by 24.1% (23.2 to 25.2; 95% CI) which equates to 12,100 missing treatments. Taken together these data reflect substantial delays in both diagnostic and treatment phases of the patient pathway.

Inequalities in cancer diagnosis outcomes in the pandemic

There are inequalities in primary care use in England, with the people who live in the poorest areas have higher rates of consultation than those in richer areas once we adjust for age. The most deprived quintile was expected to have 43,184 consultations per 100,000 patient-months (Table 2), 15% more than the least deprived.

Table 2: Observed post COVID-19 primary care activity (CPRD Aurum) by IMD quintile, actual and age-standardised

	22 Mar 2020 - 30 Jan 2021 (Weekly)		
	Observed rate	Expected rate	Percentage reduction (95% CI)
Consultations per 100,000 patient-months			
IMD Quintile - 1 (least deprived)	33,813	38,601	12.4% (12.1, 12.7)
IMD Quintile - 2	34,169	38,793	11.9% (11.6, 12.3)
IMD Quintile - 3	35,069	40,127	12.6% (12.3, 12.9)
IMD Quintile - 4	33,494	37,793	11.4% (11, 11.7)
IMD Quintile - 5 (most deprived)	34,561	38,212	9.6% (9.2, 9.9)
Consultations per 100,000 patient-months (Age-standardised*)			
IMD Quintile - 1 (least deprived)	32,927	37,636	12.5% (12.2, 12.8)
IMD Quintile - 2	33,916	38,647	12.2% (11.9, 12.6)
IMD Quintile - 3	35,535	40,870	13.1% (12.7, 13.4)
IMD Quintile - 4	36,271	41,148	11.9% (11.5, 12.2)
IMD Quintile - 5 (most deprived)	38,997	43,184	9.7% (9.4, 10)

*Age-standardisation is performed according to the European Standard Population (ESP)

The reduction of consultations over the period 22 March 2020-30 January 2021 was smallest for those in most deprived areas. Their reduction in consultations for the non-age-standardised figures was 9.6% (9.2 to 9.9), while for the least

^{xii} Dates for the CWT and NCRAS analysis do not line up with the CPRD analysis because the latter is conducted weekly, not monthly.

1 deprived the reduction was 12.4% (13.2 to 13.9; 95% CI) (Table 2). Weekly levels of age-standardised consultations per
2 100,000 patient-months by IMD quintile are presented in Annex 7.

3 Despite a smaller reduction in primary care contacts, we observe the largest reduction in both urgent cancer referrals
4 and first treatments for cancer for patients living in the most deprived areas. The NCRAS data equity pack presents the
5 number of urgent cancer referrals and first cancer treatments by IMD quintile^{xiii}. Figure 3 shows the reduction in urgent
6 cancer referrals and first treatments for newly diagnosed cancer by IMD quintile.

7
8
9 There was a greater percentage reduction in urgent cancer referrals for those living in the most deprived areas in
10 England, who experienced a 17.6% (17.2 to 18.0; 95% CI) reduction between 01 April 2020 and 31 January 2021
11 compared with the same period 12 months before, while referrals for the least deprived quintile fell by proportionately
12 less: 15.3% (14.9 to 15.6; 95% CI). This equates to a reduction of 61,500 referrals for the most deprived and 62,600 or
13 the least: without adjusting for age, the most deprived quintile had a smaller proportion of the pre-pandemic urgent
14 cancer referrals, with 350,000 referrals compared to 410,000 for the least deprived quintile from April 2019 to January
15 2020.

16
17
18 At the same time, rates of new treatment for cancer for the people living in the most deprived 20% of England
19 experienced a 15.8% (14.6 to 17.0; 95% CI) reduction between 01 April 2020 and 31 January 2021 compared with the
20 same period 12 months before (6,610 missing first treatments). The reduction for the least deprived was 12.6% (11.5 to
21 13.7; 95% CI) which equates to 6,880 missing first treatments.

22
23 Despite having more access to primary care for patients in more deprived areas (9.7% reduction for most deprived
24 compared to 12.5% for the least deprived), urgent cancer referrals and newly diagnosed cancers have been disrupted by
25 the pandemic more for people living in poorer areas.

26 27 28 **DISCUSSION**

29
30 The coronavirus SARS-CoV-2 (COVID-19) pandemic has had a profound impact on the management of patients with
31 cancer(21). The first national lockdown in March 2020 created a ripple of non-pharmaceutical interventions, including
32 'stay at home' orders, diminished healthcare service provision and redistribution of healthcare to COVID-19 related care
33 that has had a profound impact on cancer services(1,22).

34
35 There are also new potential barriers to the pathway that have resulted and may exacerbate these findings. For
36 example, decreases in health seeking behaviour due to fear of acquiring covid-19 infection through interactions with
37 health care settings, increasing use of remote consultations(23), changes in routine referral guidelines(24), as well as
38 changes in the capacity of acute care. The backlog for routine diagnostic services is a particular concern given that
39 approximately 40% of cancer are diagnosed through this route(25).

40
41
42 Similar issues have also been identified within other high-income country health systems. Primary care providers in eight
43 European countries experienced similar issues in how to rapidly transform services in the wake to COVID-19(26). A study
44 in Sweden found an almost identical percentage reduction in primary care consultations (12%) as a results of the
45 pandemic(27). Our results don't appear to be unique to England: while different countries can have different routes to
46 diagnosis(28), different countries with different systems also observed disruptions to cancer pathways(29–32).

47
48
49 Whilst it was already known that there had been a substantial reduction in the number of overall cancer-related
50 referrals(30,31) the quantification of this had been missing. Our findings, that primary care consultations in English NHS
51 fell by 12.4% between January 2020 and January 2021 with urgent cancer referrals even more suppressed (20.2%),
52 reflect how profound the pathway disruptions were for cancer patients. Furthermore, many cancers are picked up
53 through the course of routine referrals from general practice for non-specific symptoms. The drop in routine referrals
54 that we found (4.3 million, over this period) will inevitably translate into late-stage presentation and a substantial
55

56
57
58 ^{xiii} They do not age-standardise their results

1 reduction in outcomes. This will include wider economic costs due to more expensive, late-stage treatment and
2 productivity losses due to morbidity and premature mortality. However, the trajectory of the declines reflect not just
3 changes to national policy in terms of NPI, but also knock-on effects around public behaviour, primary care staffing,
4 downstream reductions in diagnostics and an overall increase in friction across all cancer pathways and systems.

5
6 This reduction in cancer pathways through primary care needs to be put in the context of wider disruptions. The
7 suspension of national cancer screening programmes meant that around 2 million people were not screened for cancer
8 through national programs(32,33). Moreover, delays in cancer diagnoses and treatments have consistently been
9 associated with poorer outcomes(1,2). The COVID-19 pandemic has also exacerbated the worst 62-day cancer waiting
10 time targets in the last decade where 1 of 4 patients urgently referred from primary care between April 2020 and
11 January 2021 did not receive treatment within 62 days(31).

12
13 In our analysis of urgent cancer referrals by site in relation to reductions seen in first treatments significant differences
14 were seen. Urological cancers (testis, renal, prostate and urothelial) have been particularly impacted with greater than
15 25% decrease both in urgent referrals and first treatments. This suggests that outcomes will be particularly impacted in
16 this group. Lung, skin and lower GI (colon and rectal) cancer also experienced significant declines in urgent referrals.
17 Breast cancer was the least impacted of all in terms of urgent referrals but experienced a 25% reduction in first
18 treatments. This highlights how much breast cancer diagnosis relies on screening programmes, which have suffered
19 badly as a result of the pandemic(31). Although it is likely that some cancer patients have already been 'lost' to the
20 system i.e. died of COVID-19 or other non-COVID-19 comorbidities, a significant number will now present with later
21 stage disease.
22
23
24

25 Our findings also reflect socioeconomic inequalities with more profound decrease in urgent cancer referrals and first
26 treatments for the most deprived populations, despite relatively better preservation of consultation rates. This is
27 unexpected and extremely worrying, indicating greater disruption to the diagnostic pathway for patients living in more
28 deprived areas, whose cancer outcomes were typically worse than their less deprived counterparts pre-
29 pandemic(34,35). Resilience in primary care is key for the cancer diagnosis pathway and must be developed. We know
30 that there are challenges associated with resourcing health services in poorer areas (the inverse care law(36)), resulting
31 in fewer resources per head of sick patient(10) and shorter consultation times(37). Further research should focus on
32 understanding to what extent complex morbidity, which is greater in poorer areas(8,38), contributes to the disruption of
33 the cancer diagnostic pathway. Greater understanding would help health systems better prepare for the kind of
34 disruption we have seen as a result of COVID-19.
35
36
37

38 **Limitations**

39
40 This study uses multiple data sets to analyse a complex and disjointed pathway. We include a primary care data set that
41 uses a relatively small (500,000) patient sample. However, the CPRD data produces results that closely mirror the rates
42 of consultation per patient (and their reduction) produced in NHS Digital's appointments data(39). In addition, the
43 estimated reduction in urgent cancer referrals is close to those presented in the NCRAS's analysis of their cancer registry
44 data (Table 1a & Table 1b). It is not yet possible to link these data on a patient basis due to delays in data access and
45 once possible further research would be illuminating.
46
47

48 **Conclusions**

49
50 Our data reflects a disruption to a complex interaction of several systemic issues that place a great deal of impetus on
51 the role of primary care in ensuring early diagnosis of cancer. Primary care was already under strain pre-pandemic, with
52 low levels of investment and workforce deficits(40). Particularly in areas of high deprivation, general practice is under-
53 funded and under staffed relative to need(7,8,10).
54

55 Early cancer diagnosis requires concordance of each participant and mechanism - including patients' awareness and
56 ability to present with cancer symptoms, the ability of GPs to detect and urgently refer possible cancer cases and
57 sufficient diagnostic capacity (in terms of both workforce and equipment) to enable swift referrals and minimise delays
58 to diagnosis and treatment. Every one of these nodes on the pathway to early diagnosis has been affected by the
59

1 pandemic and the national policy response. However, further work is required as there is currently little understanding
2 and even less evidence about how much each disruption is ultimately impacting cancer pathways.

3 The impact of the pandemic on cancer diagnosis and time to treatment shown here is very serious. However, what is
4 more concerning is the unequal and inequitable impact on those worst off. Cancer as a disease area "*magnifies what we*
5 *know to be true about the totality of the health care system. It exposes all its strengths and weaknesses*"(41). Our results
6 further evidence the strain on primary care, the presence of the inverse care law(36), and the dire need to address the
7 inequalities so sharply brought into focus by the pandemic. We need to address the disconnect between the importance
8 we place on the role of primary care in cancer care and the resources we devote to it.

Figure 1: Observed vs expected primary care activity, 01 Jan 2019 – 30 January 2021 (per 100,000 patient-months) (CPRD Aurum data) Panels: a. Consultations, b. Urgent cancer (2 week wait) referrals from primary care, c. Routine referrals from primary care

Figure 2: Percentage difference between observed and expected first treatments for new cancer and urgent cancer referrals by tumour location from NCRAS Cancer equity data pack (%), 01 Apr 2020 to 31 Jan 2021)

Figure 3: Percentage difference between observed and expected urgent cancer referrals and first treatments for cancer by IMD quintile (01 Apr 2020 – 31 Jan 2021)

Contributors: Data cleaning and analysis was conducted by TW. TW conceived the study with input from the coauthors and wrote the first draft. All the authors provided critical scholarly feedback on the manuscript. All the co-authors approved of the final version of the manuscript. TW and RS are the guarantors. The corresponding author attests that all listed authors meet authorship criteria and that no others meeting the criteria have been omitted.

Competing interests: None

Funding: This publication is funded through the UK Research and Innovation GCRF grant ES/P010962/1.

Data Availability statement:

The primary care activity data may be obtained from a third party and are not publicly available. We used de-identified primary care data from the Clinical Practice Research Datalink (CPRD). For more information please visit: <https://www.cprd.com/Data-access>, enquiries can be emailed to enquiries@cprd.gov.uk. Scientific approval for this study was given by the CPRD Independent Scientific Advisory Committee (ISAC). The study was approved by the Independent Scientific Advisory Committee for CPRD research (20_143). The data is provided by patients and collected by the NHS as part of their care and support.

Other data sources are available in a public, open access repository: Cancer Wait Times at <https://www.england.nhs.uk/statistics/statistical-work-areas/cancer-waiting-times/> and the NCRAS Cancer data equity pack is available at http://www.ncin.org.uk/local_cancer_intelligence/cadeas.

- Primary care is key part of the pathway for early cancer diagnosis through both routine and 2ww referrals
 - Cancer diagnosis rates have experienced a sustained fall since the start of the COVID-19 pandemic and introduction of non-pharmaceutical interventions (NPIs) 'lockdowns'.
 - The fall in urgent cancer referral is larger than the fall in primary care contacts, implying that the content of consultations has shifted away from potential cancer diagnosis.
 - Despite having a smaller reduction in primary care contact through the pandemic, patients living in poorer areas have had larger reductions in urgent cancer referrals and first treatments for new cancer.
 - Government, patients and primary care staff must work together to catch up on missing diagnosis.
 - Resilience in primary care is key for the cancer diagnosis pathway and must be developed for future disruptions, particularly in poorer areas where care is more complex.

Annex 1: NCRAS data equity pack, technical notes

CADEAS and NCRAS have produced two equity data packs presenting the latest national data on the number of urgent suspected two-week wait referrals and first definitive treatments for cancer. These data packs are produced on the basis of the Cancer Wait Times data, with analysis from Hospital Episode Statistics (HES) and other sources outlined in their technical notes.

“Any differences between treatment volumes in the published official statistics and the volumes presented in this pack are because:

- Data was extracted from the CWT system at a slightly different time.
- Data included here is based on England residents only.

Additional logic has been applied to remove treatments where some of the information required for this equity analysis is missing or there are potential data quality issues, for example cases with a mismatch between the suspected cancer referral type and sex (eg. gynaecological cancer treatments for men, testicular cancer treatments for women), and suspected cancer referral type and age (eg. suspected children's cancer for patients aged 20 and over).” – NCRAS Cancer data equity pack technical notes, final tab within the downloaded spreadsheet. Available under “Links to data”:

http://www.ncin.org.uk/local_cancer_intelligence/cadeas as at 26/01/2022

Annex 2: Consultation definition

CPRD Aurum data dictionary sets out the structure of the data. Within the consultation file there are two variables one can use to identify whether a primary care contact, rather than an administrative note (“EMIS® consultation source identifier” and “Consultation source code identifier”).

The EMIS consultation source identifier is the primary variable used. We include the following observations of this variable:

Acute visit, Casualty attendance, Clinic, Emergency appointment, Emergency consultation, Enterprise consultation, Face to face consultation, Follow-up/routine visit, Gp surgery, Home visit, Home visit note, Main surgery, Nursing home, Nursing home visit note, Online services message, Other, Residential home, Residential home visit note, Same day appointment, Surgery consultation, Telephone encounter, Urgent consultation, Walk-in centre, Walk-in clinic

We also include instances where EMIS consultation source identifier is “awaiting review” and the Consultation source code identifier is in the following list:

Consultation, visit, seen in gp unit, seen in private clinic, seen in rapid access clinic at gp surgery, seen in urgent care centre, online communication.

We then further exclude records on the basis of the category of staff responsible for the record. The “[Job category](#)” variable from the staff file, linked by the consultation id is used. We only include as a consultation records filled out by GPs, doctors, nurses and other health care professionals as defined in CPRD’s numerical codes listed below:

GP – 4, 5, 15, 24, 31, 181, 183

Dr – 1, 41, 91, 116, 119, 121, 126, 173, 177, 197

Nurse – 8, 9, 27, 33, 47, 48, 50, 55, 59, 60, 61, 111

Other healthcare professional - 2, 3, 6, 7, 10:14, 16, 17, 34:37, 42, 43, 52, 54, 58, 62:65, 68, 72, 73, 77, 80, 82, 83, 86:89, 94, 95, 97, 100:102, 105, 106, 112:114, 118, 122, 125, 127, 131, 135, 136, 138, 141, 142, 145, 148, 149, 154, 156, 158, 168, 185, 186, 188, 189, 204, 208

In Table A2.1 we present the CPRD Aurum Staff Category list.

In Table A2.2 we present the total number of consultations identified from 01 January 2016 to 31 January 2021, the count with each combination of staff category, “EMIS® consultation source identifier” and “Consultation source code identifier” in Table A2.2 we show the count of records that were excluded, highlighting those that were excluded on the basis of staff category, not the consultation file description variables.

Annex 3: NHS targets for cancer wait times

		Operational standard	
Maximum two weeks from	Receipt of urgent referral for suspected cancer to first outpatient attendance	93%	
	Receipt of referral of any patient with breast symptoms (where cancer not suspected) to first hospital assessment	93%	
Maximum 28 days from	Receipt of two week wait referral for suspected cancer, receipt of urgent referral from a cancer screening programme (breast, bowel, cervical), and receipt of two week wait referral of any patient with breast symptoms (where cancer not suspected), to the date the patient is informed of a diagnosis or ruling out of cancer	75%	
Maximum one month (31 days) from:	Decision to treat to first definitive treatment	96%	
	Decision to treat/earliest clinically appropriate date to start of second or subsequent treatment(s) for all cancer patients including those diagnosed with a recurrence where the subsequent treatment is:	surgery	94%
		drug treatment	98%
		radiotherapy	94%
Maximum two months (62 days) from:	Urgent referral for suspected cancer to first treatment (62-day classic)	85%	
	Urgent referral from a NHS Cancer Screening Programme (breast, cervical or bowel) for suspected cancer to first treatment	90%	

Annex 4: Comparing Cancer Wait Times counts for referrals and first treatments with the NCRAS data equity pack

Table A4.1: Comparing Cancer Wait Times counts for referrals and first treatments with the NCRAS data equity pack

Cancer wait times data	01 Apr 2020 - 31 Jan 2021					
	First treatments for new cancer			Urgent cancer referrals		
	Observed	Expected	Percentage change (95% CI)	Observed	Expected	Percentage change (95% CI)
All	224,323	267,946	-16.3% (-16.6, -15.9)	1,673,775	2,071,967	-19.2% (-19.3, -19.1)

STROBE Statement—checklist of items that should be included in reports of observational studies

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	3
Objectives	3	State specific objectives, including any prespecified hypotheses	3
Methods			
Study design	4	Present key elements of study design early in the paper	4
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	4
Participants	6	(a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants	4
		(b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case	
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	4/5
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	4/5
Bias	9	Describe any efforts to address potential sources of bias	5/6
Study size	10	Explain how the study size was arrived at	4
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	4-6
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	5/6
		(b) Describe any methods used to examine subgroups and interactions	5/6
		(c) Explain how missing data were addressed	4-6
		(d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy	N/A
		(e) Describe any sensitivity analyses	4-6

60**Results**

Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	4/5
		(b) Give reasons for non-participation at each stage	N/A
		(c) Consider use of a flow diagram	N/A
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	6-8
		(b) Indicate number of participants with missing data for each variable of interest	6-8
		(c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount)	N/A
Outcome data	15*	<i>Cohort study</i> —Report numbers of outcome events or summary measures over time	6/7
		<i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure	N/A
		<i>Cross-sectional study</i> —Report numbers of outcome events or summary measures	N/A
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	6-8
		(b) Report category boundaries when continuous variables were categorized	N/A
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	N/A
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	6-8

Discussion

Key results	18	Summarise key results with reference to study objectives	9
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	9/10
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	10
Generalisability	21	Discuss the generalisability (external validity) of the study results	9/10

Other information

Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	1
---------	----	---	---

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. Abstract

Objectives

We explore the routes to cancer diagnosis to further understanding of the inequality in the reduction in detection of new cancers since the start of the pandemic. We use different data sets to assess stages in the cancer pathway: primary care data for primary care consultations, routine and urgent referrals and published analysis of cancer registry data for appointments and first treatments.

Setting

Primary and cancer care

Participants

In this study we combine multiple data sets to perform a population-based cohort study on different areas of the cancer pathway. For primary care analysis, we use a random sample of 500,000 patients from the Clinical Practice Research Datalink (CPRD). Post-referral we perform a secondary data analysis on the Cancer Wait Times data and the National Cancer Registry Analysis Service (NCRAS) COVID-19 data equity pack.

Outcome measures:

Primary care: consultation, urgent cancer referral and routine referral rates, then appointments following an urgent cancer referral, and first treatments for new cancer, for all and by quintile of patient's local area Index of Multiple Deprivation.

Results

Primary care contacts and urgent cancer referrals fell by 12.4% (12.3 to 12.6; 95% CI) and 20.2% (18.1 to 22.3; 95% CI) respectively, while routine referrals have not recovered to pre-pandemic levels. Reductions in first treatments for newly diagnosed cancers are down 16.3% (15.9 to 16.6; 95% CI). The reduction in the number of two week wait referrals and first treatments for all cancer has been largest for those living in poorer areas, despite having a smaller reduction in primary care contact.

Conclusions

Our results further evidence the strain on primary care and the presence of the inverse care law, and the dire need to address the inequalities so sharply brought into focus by the pandemic. We need to address the disconnect between the importance we place on the role of primary care and the resources we devote to it.

Key Words: Oncology, Primary Care, COVID-19

Strengths and Limitations

- This study draws from multiple data sets along the complex, multidisciplinary cancer pathway.
- We use a rich primary care data set containing patient level primary care activity linked to patients' local area socioeconomic indicator.
- Our primary care patient sample is relatively small (500,000 active patients from January 2016 to January 2021), however the data produces results that closely mirror the rates of consultation and urgent cancer referral per patient produced in publicly available national data sets.

INTRODUCTION

The COVID-19 pandemic has had a profound impact on UK's health system. Each part of the UK's National Health Service has been impacted in different ways, and we are still feeling many of the consequences of both the COVID-19 pandemic and the public health measures put in place to manage it (non-pharmaceutical interventions; NPI). Cancer is one of the most complicated diseases that the UK health system must manage, being responsible for over one in four UK deaths in 2019. Cancer outcomes are acutely sensitive to changes in social determinants, patient pathways and service provision. Delays in both diagnosis and treatment have significant impacts on patient outcomes(1,2). Pandemic related diagnostic delays, lack of capacity and downstream stage progression (to more advanced disease) are already being seen(3). In addition, the impact of the pandemic needs to be seen in the context of an already overstretched UK cancer care system pre-pandemic that was 'burning hot' even in normal times(4).

Primary care sits at the heart of the cancer patient pathway and is the most crucial interface for early diagnosis and referral to hospital-based care, in addition to their wider support of cancer patient undergoing and post treatment. As models of cancer care have evolved in light of both technical advances and an ageing co-morbid population primary care has become an increasingly important aspect of integrated cancer care and an expansion of General Practitioner (GP) roles in cancer care(5). On average 22.5% of patients diagnosed with cancer are referred to oncology diagnostic services from primary care, but this reflects wide site-specific variation from as little as 8.3% of breast cancer to 42% for bladder cancer(6).

It is important to reflect that prior to the start of the COVID-19 pandemic primary care had seen significant declines in overall resourcing relative to the funding of the rest of the NHS and compared to growing levels of disease burden that is managed in primary care. In addition, there is growing evidence that primary care has been under greater pressure in more deprived areas, with higher levels of staff turnover(7), higher levels of complex multimorbidity(8), higher numbers of consultations(9) and lower levels of funding and fewer GPs per capita once levels of ill health are taken into account(10). These pressures on primary care, and a desire to correct them, have been recognised in the NHS Long Term Plan(11).

Thus, to understand the COVID-19's impact on primary care and the downstream impact on cancer outcomes we need to see that the pandemic arrived when the system that was already struggling to cope. Prior to COVID-19, the central role of primary care as agents of change in reducing inequalities had been the subject of much debate yet could do little in the face of political avoidance of health equity(12). Primary care had become a mirror on inequalities but also subject to significant pressures from these growing inequalities that had put practices in deprived populations under significant stress. Yet despite this, equity-oriented primary care reform in England in the mid-to-late 2000s may have helped to reduce socioeconomic inequality in health(13).

[Box]

COVID-19 was officially declared a pandemic by the WHO on 11 March 2020, and the UK announced its first full lockdown on 23rd March. In the following months UK NPI were eased, schools reopened in phases, non-essential shops reopened and in August the population were encouraged to eat out. Some restrictions were re-imposed in September and October, on the 5th of November 2020 a second brief national locked lasted until 2nd December. On the 6th of January a third national lockdown was introduced(14).

[End box]

It is now clear that the UK experience of the pandemic was one of the worst in the world, both in terms of excess mortality (both COVID-19 and non-COVID-19) and the impact of NPI (lockdowns) on both the ability of health services to continue provide care and the impact of messaging (stay at home) on patients' timely presentation for care(15). However, the overwhelming focus of impact studies on cancer care has been on hospital-based services, including diagnostics. Given primary care's central role in pathways to diagnosis and integrated cancer care, including survivorship there has been little insight around how overall changes in consultation rates impacted both routine and two week wait referrals as well as how this varied both in terms of site-specific cancers and as a consequence of socio-economic

inequalities. This study aimed to analyse the socioeconomic inequalities in the impact of NPI measures taken in response to COVID-19 on consultations and routine and urgent cancer referrals in primary care and cancer diagnosis in secondary care.

METHODS

Study design, data sources and participants

We perform a population-based cohort study using the following three separate sources.

Primary care data – CPRD Aurum

Primary care electronic health records were obtained from the Clinical Practice Research Datalink Aurum database (henceforth CPRD). We included patient records from 01 January 2016 to 31 January 2021. Pre-pandemic data were included to establish long-term trends and patterns of seasonality in primary care use and referrals to secondary care. Similar to recent analysis of the COVID-19 pandemic(16), our analysis focusses on comparing observed levels of activity to the expected following the introduction of NPI in England in March 2020.

CPRD contains anonymised patient primary care data from approximately 7% of the UK population and is broadly representative in terms of age, sex, and ethnicity(17). The patient records include information on consultations, patient demographic information, diagnoses, medication prescriptions, and referrals to secondary care.

The period of eligibility for study inclusion, which starts on the latest of the study start date (01/01/2016) or the patient's registration to their practice. A patient's period of eligibility ends on the earliest of leaving their practice, the end of data collection from their practice or their death. Primary care records from CPRD were linked to the deciled index of multiple deprivation (IMD) from 2015ⁱ(18) of each patient's lower layer super output area (LSOAⁱⁱ). 500,000 patients were randomly sampled from the CPRD population in England who were eligible for linkage within the defined study period.

Cancer wait times data

Cancer waiting times (CWT) measure performance against the NHS Constitution Standards, recording the number of patients screened, referred to oncology specialists, diagnosed and treated for cancer. These measures are used by local and national organisations to monitor the timely delivery of services to patients, they are published quarterly by NHS Digitalⁱⁱⁱ.

Cancer diagnosis by socioeconomic status - NCRAS Cancer equity data

Data on cancer diagnosis by socioeconomic group was drawn from CADEAS and National Cancer Registry Analysis Service (NCRAS) which have two published data sets(19), presenting the latest national data on:

- i. The number of urgent suspected two-week wait referrals^{iv} and,
- ii. First definitive treatments for cancer^v.

ⁱ <https://www.gov.uk/government/statistics/english-indices-of-deprivation-2015>

ⁱⁱ Geographic areas in England and Wales that are built from groups of contiguous Output Areas and have been automatically generated to be as consistent in population size as possible, and typically contain from four to six Output Areas. The Minimum population is 1000 and the mean is 1500. For more details visit:

https://datadictionary.nhs.uk/nhs_business_definitions/lower_layer_super_output_area.html#:~:text=Lower%20Layer%20Super%20Output%20Areas,statistics%20in%20England%20and%20Wales.

^v <http://www.ncin.org.uk/view?rid=4347> (accessed on 24 January 2022)

1 These data packs are produced based on the CWT data, with analysis from Hospital Episode Statistics (HES) and other
2 sources outlined in their technical notes (further details in Annex 1).

3 **Study Outcomes**

4 Primary care consultations

5 We define consultations in CPRD data by a set of rules developed based on two variables in the consultations file^{vi}
6 (“EMIS® consultation source identifier” and “Consultation source code identifier”)^{vii}. In line with the approach taken by
7 Carey et al 2012 for CPRD Gold data, we use a combination of the consultation code and the category of the record to
8 identify consultations (details in Annex 2).

9 Using the observation file in CPRD Aurum, we were also able to identify where patients had influenza vaccinations. We
10 look to exclude flu vaccines from our analysis on the basis that the programme was expanded in 2020/21 to achieve
11 maximum uptake^{viii}. To help with the comparability of consultations in the two periods, we removed primary care
12 appointments that included a flu vaccine.

13 Referrals from primary care: routine and urgent cancer

14 Referrals in CPRD are categorized into routine and “urgent cancer”. Referrals from the ‘referral file’ are linked to
15 patients, no additional data cleaning steps were taken in the analysis of referrals.

16 First appointment following an urgent referral

17 The CWT data present monthly counts of patients in England who have been recorded as receiving a first appointment
18 following an urgent referral from primary care. The CWT data record this because the NHS have a 2-week performance
19 target (Annex 3).

20 The NCRAS cancer equity data contain monthly counts in England of appointments following an urgent cancer referral
21 broken down by tumour type and by deprivation according to patient’s place of residence.

22 First treatment following a cancer diagnosis

23 The CWT data present monthly counts of patients in England who have been recorded as receiving a first treatment for a
24 new cancer diagnosis. The CWT data record this because the NHS have a 31-day performance target (Annex 3).

25 The NCRAS cancer equity data contain monthly counts in England of first treatments for new cancer broken down by
26 tumour type and by deprivation according to patient’s place of residence.

27 **Patient and public involvement**

28 No patients involved

29 **Data analysis**

30 CPRD & CWT

31 For both CPRD and CWT we separate the data into two, before and after the introduction of the first NPI.

1 Our analysis of CPRD primary care is conducted weekly and split into two periods before and after the introduction of
2 NPI on March 23rd 2020 (pre-NPI data is from 03 January 2016 to 21 March 2020, our post-NPI onset data is 22 March
3 2020 to 30 January 2021).

4 CWT data is reported monthly, our pre-NPI data is therefore from 01 October 2009 to 31 March 2020, our post-NPI
5 onset period is 01 April 2020 to 31 January 2021.

6 We perform a linear regression of consultations, urgent and routine referrals from CPRD data and appointments
7 following an urgent cancer referral and first treatments from CWT data over time to estimate expected values for the
8 post-NPI onset period, based on predicted values from the data pre-NPI. To account for seasonality and time trends we
9 include months as a categorical variable and time as a continuous variable, the approach taken by Carr et al.(16). In the
10 case of weekly primary care data, we observe large dips in activity in weeks that include bank holidays and include a
11 categorical variable on the basis of the number of bank holidays in each week (in the winter holidays in England there is
12 always one week with two bank holidays). Our primary care activity rates are presented per 100,000 patient-months^{ix}.
13 When analysing primary care consultation rates by socioeconomics we adjust for population age. We do so when
14 calculating the consultation rates by IMD quintile and weighting the sample according to the European Standard
15 Population^x (ESP).

20 *NCRAS equity data*

21
22 The analysis presented in the equity data pack compares new instances of first treatments in months during the
23 pandemic (01 April 2020 – 31 Jan 2021) compared with the same months in 2019/20. The analysis includes a 95%
24 confidence interval for the changes, based on rate ratios under an assumption that the population is the same in the
25 pre-COVID-19 baseline and COVID-19 months. This is calculated using the exact method described in Breslow & Day
26 1987, pp 93-95(20). The NCRAS equity data pack shows the high levels of heterogeneity in the impact of the COVID-19
27 pandemic on different tumour locations. The NCRAS data equity pack is different in its count and analysis of “all
28 tumours” compared with the Cancer Wait Times Data, this is because the data are slightly different (cleaned and
29 analysed by NCRAS – details in Annex 1). Results of our analysis with each data set are compared in Annex 4. Our
30 presentation of these data follows the same method but presents the cumulative difference for the period from April
31 2020 to the end of January compared with the previous 12 months.
32
33
34

35 **RESULTS**

36 **Overall impact of the pandemic**

37
38 In the calendar year of 2019, before the COVID-19 pandemic and the associated NPI, there was an average of 39,127
39 primary care consultations per 100,000 patient-months. This equates to 4.70 attended appointments per registered
40 patient, or an estimated 266 million appointments in primary care nationally in 2019^{xi}.
41
42

43 Primary care consultations (Figure 1 a) dropped rapidly to a low of 26,919 consultations per 100,000 patient-months in
44 the week following 29 March 2020, this was 66.0% lower than the predicted rate. Rates slowly recovered over the next
45 24 weeks and by 05 September 2020 were up to 99% of the baseline. In total there were an estimated 19.7 million (19.5
46 to 20.0; 95% CI) fewer primary care consultations in the English NHS during this period. Primary care
47 consultations again fell to below 90% of predicted levels in the third wave NPI starting on 06 January 2021, by the end of
48 January 2021 there were a further 6.4 million fewer consultations than expected. Between the start of the first NPI in
49

52

53
54 ^{ix} We adjust the weekly rates per active patient in our sample to 100,000 patient-months: Weekly rate per registered patient in
55 sample x 100,000 x (52/12)

56 ^x <https://www.causesofdeath.org/docs/standard.pdf>

57 ^{xi} For comparison the NHS national appointments data recorded 272 million attended appointments in primary care in 2019. Found
58 here: <https://digital.nhs.uk/data-and-information/publications/statistical/appointments-in-general-practice/march-2021>

March 2020 and the end of January 2021 there were an estimated 26.1 million (25.7 to 26.5; 95% CI) fewer appointments than expected (Table 1a).

In 2019, the average rate of urgent cancer (two week wait) referral was 314 per 100,000 patient-months, equating to an estimated 2.12 million for the NHS in England. Following the first NPI, urgent cancer referrals from primary care (Figure 1 b) fell to a nadir of 86 per 100,000 patient-months by 29 March 2020 (29.7% of the predicted level). Urgent cancer referrals did not return to pre-pandemic baseline until the week following 23 August 2020 equating to 317,000 (280,000 to 356,000; 95% CI) estimated lost urgent cancer referrals over this period. There was a second fall in urgent cancer referrals from primary care in the winter to below 90% of the baseline following the third lockdown (164 referrals per 100,000 patient-months in the week beginning 27 December 2021). This resulted in a further estimated 91,705 fewer urgent cancer referrals than expected. Between the start of the first NPI in March 2020 and the end of January 2021 there were 395,000 (344,000 to 446,000; 95% CI) fewer urgent cancer referrals than expected (Table 1a).

Routine referrals however have shown a different trajectory in that their rates did not recover to pre-pandemic levels (Figure 1 c). As a share of predicted levels routine referrals had the greatest fall, dropping to 16.1% of predicted rates in the week from 19 April 2020. From then to the end of January the closest it came to predicted levels was 80.3% in the week flowing 13 September 2020. For the four weeks in January 2021, it had fallen back down to 60-70% of predicted rates. In 2019 there were an average of 1,801 routine referrals per 100,000 patient-months from primary care, equivalent to an estimated 12.2 million for the NHS in England. Between the start of the first NPI in March 2020 and the end of January 2021 there were 4.33 million (4.21 to 4.46; 95% CI) fewer routine referrals than expected (Table 1a).

Patient demographics and patient-time and total numbers of observed consultations and routine and urgent referrals in our CPRD sample are presented in Annex 5.

Table 1a: Observed post COVID-19 primary care activity (CPRD Aurum) 22 March 2020 – 30 January 2021

	Observed rate	Expected rate	Percentage reduction (95% CI)	Estimated # missing from England population, to 3 significant digits (95% CI)
Event rate per 100,000 patient-months				
Consultations	34,201	38,684	11.6% (11.4, 11.7)	26,100,000 (25,700,000, 26,500,000)
Routine Referrals	1,067	1,812	41.1% (40.4, 41.8)	4,330,000 (4,210,000, 4,460,000)
2 Week Wait Referrals	268	336	20.2% (18.1, 22.3)	395,000 (344,000, 446,000)

Table 1b: Observed post COVID-19 cancer diagnostic activity (Cancer Wait Times), 01 April 2020 - 31 January 2021

	Observed rate	Expected rate	Percentage reduction (95% CI)	Estimated # missing from England population, to 3 significant digits (95% CI)
Event rate per 100,000 patient-months				
First consultant appointments following urgent referral from primary care	296	366	19.2% (19.1, 19.3)	398,000 (395,000, 401,000)
Incidence rate per 100,000 patient-months				
First treatments for new cancer from the urgent primary care referral pathway	21.4	25.5	16.1% (15.5, 16.8)	23,300 (22,200, 24,400)
First treatments for new cancer from the national screening pathway	1.63	3.47	53.2% (52, 54.3)	10,400 (10,000, 10,900)
First treatments for new cancer	39.7	47.4	16.3% (15.9, 16.6)	43,600 (42,500, 44,700)

Table 1a summarises the missing appointments and referrals for the post-pandemic period. Since the start of the pandemic in March we have observed consultations rates that are 11.6% (11.4 to 11.7; 95% CI) lower than predicted by previous data. The number of referrals to secondary care per consultation has also fallen, with urgent cancer referrals 20.2% (18.1 to 22.3; 95% CI) and routine referrals 41.1% (40.4 to 41.8; 95% CI) lower than expected.

The knock-on effect of the reductions in patients' primary care appointments and referrals can be observed in the national CWT data. The number of first appointments with a cancer specialist following an urgent cancer referral has fallen by approximately the same amount as estimated for the referrals themselves: 19.2% (19.1 to 19.3; 95% CI). The number of cancer first treatments (following a diagnosis and decision to treat) was 16.3% (15.9 to 16.6; 95% CI) lower than expected, or 43,600 (42,500 to 44,700; 95% CI) missing first treatments from 01 April 2020 - 31 January 2021^{xii} (graphs of observed compared with expected are presented in Annex 6).

Urgent cancer referrals by site specific cancer from 01 April 2020 until 31 January 2021 showed significant heterogeneity from moderate reductions in urgent referrals for suspected breast (7.0%; 95% CI 6.6 to 7.5) and gynaecological cancers (10.3%; 95% CI 9.7 to 10.9) and greater reductions for lung (36.9%; 95% CI 36.1 to 37.8) and urological (27.2%; 95% CI 26.7 to 27.7) cancers (Figure 2, further details in Annex 4, Table A4.1). To show how pathway delays interface with reductions in cancer referrals we also examined reductions in first treatments for the same site-specific cancers over this period (Figure 2). Breast and urological cancers observed the greatest reduction in new first treatments: Breast fell by 24.8% (23.6 to 25.9; 95% CI) which equates to 10,000 missing treatments and urological by 24.1% (23.2 to 25.2; 95% CI) which equates to 12,100 missing treatments. Taken together these data reflect substantial delays in both diagnostic and treatment phases of the patient pathway.

Inequalities in cancer diagnosis outcomes in the pandemic

There are inequalities in primary care use in England, with the people who live in the poorest areas have higher rates of consultation than those in richer areas once we adjust for age. The most deprived quintile was expected to have 43,184 consultations per 100,000 patient-months (Table 2), 15% more than the least deprived.

Table 2: Observed post COVID-19 primary care activity (CPRD Aurum) by IMD quintile, actual and age-standardised

	22 Mar 2020 - 30 Jan 2021 (Weekly)		
	Observed rate	Expected rate	Percentage reduction (95% CI)
Consultations per 100,000 patient-months			
IMD Quintile - 1 (least deprived)	33,813	38,601	12.4% (12.1, 12.7)
IMD Quintile - 2	34,169	38,793	11.9% (11.6, 12.3)
IMD Quintile - 3	35,069	40,127	12.6% (12.3, 12.9)
IMD Quintile - 4	33,494	37,793	11.4% (11, 11.7)
IMD Quintile - 5 (most deprived)	34,561	38,212	9.6% (9.2, 9.9)
Consultations per 100,000 patient-months (Age-standardised*)			
IMD Quintile - 1 (least deprived)	32,927	37,636	12.5% (12.2, 12.8)
IMD Quintile - 2	33,916	38,647	12.2% (11.9, 12.6)
IMD Quintile - 3	35,535	40,870	13.1% (12.7, 13.4)
IMD Quintile - 4	36,271	41,148	11.9% (11.5, 12.2)
IMD Quintile - 5 (most deprived)	38,997	43,184	9.7% (9.4, 10)

*Age-standardisation is performed according to the European Standard Population (ESP)

The reduction of consultations over the period 22 March 2020-30 January 2021 was smallest for those in most deprived areas. Their reduction in consultations for the non-age-standardised figures was 9.6% (9.2 to 9.9), while for the least

^{xii} Dates for the CWT and NCRAS analysis do not line up with the CPRD analysis because the latter is conducted weekly, not monthly.

1 deprived the reduction was 12.4% (13.2 to 13.9; 95% CI) (Table 2). Weekly levels of age-standardised consultations per
2 100,000 patient-months by IMD quintile are presented in Annex 7.

3 Despite a smaller reduction in primary care contacts, we observe the largest reduction in both urgent cancer referrals
4 and first treatments for cancer for patients living in the most deprived areas. The NCRAS data equity pack presents the
5 number of urgent cancer referrals and first cancer treatments by IMD quintile^{xiii}. Figure 3 shows the reduction in urgent
6 cancer referrals and first treatments for newly diagnosed cancer by IMD quintile.

7
8
9 There was a greater percentage reduction in urgent cancer referrals for those living in the most deprived areas in
10 England, who experienced a 17.6% (17.2 to 18.0; 95% CI) reduction between 01 April 2020 and 31 January 2021
11 compared with the same period 12 months before, while referrals for the least deprived quintile fell by proportionately
12 less: 15.3% (14.9 to 15.6; 95% CI). This equates to a reduction of 61,500 referrals for the most deprived and 62,600 or
13 the least: without adjusting for age, the most deprived quintile had a smaller proportion of the pre-pandemic urgent
14 cancer referrals, with 350,000 referrals compared to 410,000 for the least deprived quintile from April 2019 to January
15 2020.

16
17
18 At the same time, rates of new treatment for cancer for the people living in the most deprived 20% of England
19 experienced a 15.8% (14.6 to 17.0; 95% CI) reduction between 01 April 2020 and 31 January 2021 compared with the
20 same period 12 months before (6,610 missing first treatments). The reduction for the least deprived was 12.6% (11.5 to
21 13.7; 95% CI) which equates to 6,880 missing first treatments.

22
23 Despite having more access to primary care for patients in more deprived areas (9.7% reduction for most deprived
24 compared to 12.5% for the least deprived), urgent cancer referrals and newly diagnosed cancers have been disrupted by
25 the pandemic more for people living in poorer areas.

26 27 28 **DISCUSSION**

29
30 The coronavirus SARS-CoV-2 (COVID-19) pandemic has had a profound impact on the management of patients with
31 cancer(21). The first national lockdown in March 2020 created a ripple of non-pharmaceutical interventions, including
32 'stay at home' orders, diminished healthcare service provision and redistribution of healthcare to COVID-19 related care
33 that has had a profound impact on cancer services(1,22).

34
35 There are also new potential barriers to the pathway that have resulted and may exacerbate these findings. For
36 example, decreases in health seeking behaviour due to fear of acquiring COVID-19 infection through interactions with
37 health care settings, increasing use of remote consultations(23), changes in routine referral guidelines(24), as well as
38 changes in the capacity of acute care. The backlog for routine diagnostic services is a particular concern given that
39 approximately 40% of cancer are diagnosed through this route(25).

40
41
42 Similar issues have also been identified within the health systems of other high-income countries. Primary care providers
43 in eight European countries experienced similar issues in how to rapidly transform services in the wake to COVID-19(26).
44 A study in Sweden found an almost identical percentage reduction in primary care consultations (12%) as a results of the
45 pandemic(27), in Norway there was a 24% reduction in cancer referrals(28), the Netherlands had a 26% reduction in
46 non-skin cancer diagnoses(29) and in Belgium there was a 44% reduction in diagnosis of invasive tumours in the first
47 wave of the pandemic(30). Our results don't appear to be unique to England: while different countries can have
48 different routes to diagnosis(31), many countries also observed disruptions to cancer pathways(32–35).

49
50
51 Whilst it was already known that there had been a substantial reduction in the number of overall cancer-related
52 referrals(36,37) the quantification of this had been missing. Our findings, that primary care consultations in English NHS
53 fell by 12.4% between January 2020 and January 2021 with urgent cancer referrals even more suppressed (20.2%),
54 reflect how profound the pathway disruptions were for cancer patients. Furthermore, many cancers are picked up
55

56
57
58 ^{xiii} They do not age-standardise their results

through the course of routine referrals from general practice for non-specific symptoms. The drop in routine referrals that we found (4.3 million, over this period) will inevitably translate into late-stage presentation and a substantial reduction in outcomes. This will include wider economic costs due to more expensive, late-stage treatment and productivity losses due to morbidity and premature mortality. However, the trajectory of the declines reflect not just changes to national policy in terms of NPI, but also knock-on effects around public behaviour, primary care staffing, downstream reductions in diagnostics and an overall increase in friction across all cancer pathways and systems.

This reduction in cancer pathways through primary care needs to be put in the context of wider disruptions. The suspension of national cancer screening programmes meant that around 2 million people were not screened for cancer through national programs(38,39). Moreover, delays in cancer diagnoses and treatments have consistently been associated with poorer outcomes(1,2). The COVID-19 pandemic has also exacerbated the worst 62-day cancer waiting time targets in the last decade where 1 of 4 patients urgently referred from primary care between April 2020 and January 2021 did not receive treatment within 62 days(37).

In our analysis of urgent cancer referrals by site in relation to reductions seen in first treatments significant differences were seen, which is also reflected in the international evidence. Urological cancers (testis, renal, prostate and urothelial) have been particularly impacted with greater than 25% decrease both in urgent referrals and first treatments. This suggests that outcomes will be particularly impacted in this group. Lung, skin and lower GI (colon and rectal) cancer also experienced significant declines in urgent referrals, in the Netherlands there was a 60% reduction in skin cancer diagnosis during the first wave(29).

Breast cancer was the least impacted of all in terms of urgent referrals but experienced a 25% reduction in first treatments. This highlights how much breast cancer diagnosis relies on screening programmes which have suffered badly as a result of the pandemic, in England(37) and internationally(40). In England, head and neck cancers (HNC) saw a 10.2% (7.6 to 12.7; 95% CI) reduction in diagnosis, while studies in other geographies showed wide differences in the measures impacts of the pandemic on HNC: a study in Ontario, Canada found no evidence of a reduction in head and neck cancer diagnosis following an initial drop in the 6 weeks following lockdown(41), a clinic in Italy had just a 3.7% reduction in HNC(42), a 14% reduction in Belgium(30), a clinic in California showed a 22% reduction(43) and a Cancer Centre in the North of England reported a 33% reduction in HNC cases(44). There is further international evidence of the impact of COVID-19 on interventions down the pathway, with reductions in radical cancer surgeries in two major cancer hubs in England and Italy(45).

Differences in systems, populations and NPI from the pandemic present high levels of complexity in tackling the recovery at both a national and local level. Although it is possible that, in many countries, some cancer patients have already been 'lost' to the system i.e. died of COVID-19 or other non-COVID-19 comorbidities, a significant number will now present with later stage disease, creating further pressure on acute cancer care.

Our findings also reflect socioeconomic inequalities, with more profound decrease in urgent cancer referrals and first treatments for the most deprived populations despite relatively better preservation of consultation rates. This is unexpected and extremely worrying, indicating greater disruption to the diagnostic pathway for patients living in more deprived areas, whose cancer outcomes were typically worse than their less deprived counterparts pre-pandemic(46,47). Resilience in primary care is key for the cancer diagnosis pathway and must be developed. We know that there are challenges associated with resourcing health services in poorer areas (the inverse care law(48)), resulting in fewer resources per head of sick patient(10) and shorter consultation times(49). Further research should focus on understanding to what extent complex morbidity, which is greater in poorer areas(8,50), contributes to the disruption of the cancer diagnostic pathway. Greater understanding would help health systems better prepare for the kind of disruption we have seen as a result of COVID-19.

Limitations

This study uses multiple data sets to analyse a complex and disjointed pathway. We include a primary care data set that uses a relatively small (500,000) patient sample. However, the CPRD data produces results that closely mirror the rates

1 of consultation per patient (and their reduction) produced in NHS Digital's appointments data(51). In addition, the
2 estimated reduction in urgent cancer referrals is close to those presented in the NCRAS's analysis of their cancer registry
3 data (Table 1a & Table 1b). It is not yet possible to link these data on a patient basis due to delays in data access and
4 once possible further research would be illuminating.

6 **Conclusions**

7 Our data reflects a disruption to a complex interaction of several systemic issues that place a great deal of impetus on
8 the role of primary care in ensuring early diagnosis of cancer. Primary care was already under strain pre-pandemic, with
9 low levels of investment and workforce deficits(52). Particularly in areas of high deprivation, general practice is under-
10 funded and under staffed relative to need(7,8,10).

13 Early cancer diagnosis requires concordance of each participant and mechanism - including patients' awareness and
14 ability to present with cancer symptoms, the ability of GPs to detect and urgently refer possible cancer cases and
15 sufficient diagnostic capacity (in terms of both workforce and equipment) to enable swift referrals and minimise delays
16 to diagnosis and treatment. Every one of these nodes on the pathway to early diagnosis has been affected by the
17 pandemic and the national policy response. However, further work is required as there is currently little understanding
18 and even less evidence about how much each disruption is ultimately impacting cancer pathways.

21 The impact of the pandemic on cancer diagnosis and time to treatment shown here is very serious. However, what is
22 more concerning is the unequal and inequitable impact on those worst off. Cancer as a disease area "*magnifies what we*
23 *know to be true about the totality of the health care system. It exposes all its strengths and weaknesses*"(53). Our results
24 further evidence the strain on primary care, the presence of the inverse care law(48), and the dire need to address the
25 inequalities so sharply brought into focus by the pandemic. We need to address the disconnect between the importance
26 we place on the role of primary care in cancer care and the resources we devote to it.

Key messages

- Primary care is key part of the pathway for early cancer diagnosis through both routine and 2ww referrals
- Cancer diagnosis rates have experienced a sustained fall since the start of the COVID-19 pandemic and introduction of non-pharmaceutical interventions (NPIs) 'lockdowns'.
- The fall in urgent cancer referral is larger than the fall in primary care contacts, implying that the content of consultations has shifted away from potential cancer diagnosis.
- Despite having a smaller reduction in primary care contact through the pandemic, patients living in poorer areas have had larger reductions in urgent cancer referrals and first treatments for new cancer.
- Government, patients and primary care staff must work together to catch up on missing diagnosis.
- Resilience in primary care is key for the cancer diagnosis pathway and must be developed for future disruptions, particularly in poorer areas where care is more complex.

Figure 1: Observed vs expected primary care activity, 01 Jan 2019 – 30 January 2021 (per 100,000 patient-months) (CPRD Aurum data) Panels: a. Consultations, b. Urgent cancer (2 week wait) referrals from primary care, c. Routine referrals from primary care

233x150mm (120 x 120 DPI)

Figure 3: Percentage difference between observed and expected urgent cancer referrals and first treatments for cancer by IMD quintile (01 Apr 2020 – 31 Jan 2021)

205x122mm (120 x 120 DPI)

Annex 1: NCRAS data equity pack, technical notes

CADEAS and NCRAS have produced two equity data packs presenting the latest national data on the number of urgent suspected two-week wait referrals and first definitive treatments for cancer. These data packs are produced on the basis of the Cancer Wait Times data, with analysis from Hospital Episode Statistics (HES) and other sources outlined in their technical notes.

"Any differences between treatment volumes in the published official statistics and the volumes presented in this pack are because:

- Data was extracted from the CWT system at a slightly different time.
- Data included here is based on England residents only.

Additional logic has been applied to remove treatments where some of the information required for this equity analysis is missing or there are potential data quality issues, for example cases with a mismatch between the suspected cancer referral type and sex (eg. gynaecological cancer treatments for men, testicular cancer treatments for women), and suspected cancer referral type and age (eg. suspected children's cancer for patients aged 20 and over)." – NCRAS Cancer data equity pack technical notes, final tab within the downloaded spreadsheet. Available under "Links to data":

http://www.ncin.org.uk/local_cancer_intelligence/cadeas as at 26/01/2022

Annex 2: Consultation definition

CPRD Aurum data dictionary sets out the structure of the data. Within the consultation file there are two variables one can use to identify whether a primary care contact, rather than an administrative note ("EMIS® consultation source identifier" and "Consultation source code identifier").

The EMIS consultation source identifier is the primary variable used. We include the following observations of this variable:

Acute visit, Casualty attendance, Clinic, Emergency appointment, Emergency consultation, Enterprise consultation, Face to face consultation, Follow-up/routine visit, Gp surgery, Home visit, Home visit note, Main surgery, Nursing home, Nursing home visit note, Online services message, Other, Residential home, Residential home visit note, Same day appointment, Surgery consultation, Telephone encounter, Urgent consultation, Walk-in centre, Walk-in clinic

We also include instances where EMIS consultation source identifier is "awaiting review" and the Consultation source code identifier is in the following list:

Consultation, visit, seen in gp unit, seen in private clinic, seen in rapid access clinic at gp surgery, seen in urgent care centre, online communication.

We then further exclude records on the basis of the category of staff responsible for the record. The "Job category" variable from the staff file, linked by the consultation id is used. We only include as a consultation records filled out by GPs, doctors, nurses and other health care professionals as defined in CPRD's numerical codes listed below:

GP – 4, 5, 15, 24, 31, 181, 183

Dr – 1, 41, 91, 116, 119, 121, 126, 173, 177, 197

Nurse – 8, 9, 27, 33, 47, 48, 50, 55, 59, 60, 61, 111

Other healthcare professional - 2, 3, 6, 7, 10:14, 16, 17, 34:37, 42, 43, 52, 54, 58, 62:65, 68, 72, 73, 77, 80, 82, 83, 86:89, 94, 95, 97, 100:102, 105, 106, 112:114, 118, 122, 125, 127, 131, 135, 136, 138, 141, 142, 145, 148, 149, 154, 156, 158, 168, 185, 186, 188, 189, 204, 208

In Table A2.1 we present the CPRD Aurum Staff Category list.

In Table A2.2 we present the total number of consultations identified from 01 January 2016 to 31 January 2021, the count with each combination of staff category, "EMIS® consultation source identifier" and "Consultation source code identifier" in Table A2.2 we show the count of records that were excluded, highlighting those that were excluded on the basis of staff category, not the consultation file description variables.

Table A2.1: CPRD Aurum Staff Job Categories

1	1 Consultant	51 Helper/Assistant
2	2 Hospital Practitioner	52 Community Mental Health Nurse
3	3 Clinical Medical Officer	53 Senior Administrator
4	4 General Medical Practitioner	54 Technician - Healthcare Scientists
5	5 Salaried General Practitioner	55 Associate Practitioner - Nurse
6	6 Midwife - Sister/Charge Nurse	56 Senior Manager
7	7 Midwife	57 Community Administrator
8	8 Community Practitioner	58 Associate Specialist
9	9 Community Nurse	59 Student Practice Nurse
10	10 Chiropodist/Podiatrist	60 Nurse Manager
11	11 Dietitian	61 Sister/Charge Nurse
12	12 Pharmacist	62 Psychotherapist
13	13 Clinical Psychologist	63 Osteopath
14	14 Health Care Support Worker	64 Social Care Support Worker
15	15 Associate Practitioner - General Practitioner	65 Assistant Psychologist
16	16 Counsellor	66 Officer
17	17 Phlebotomist	67 Technician - Admin & Clerical
18	18 Clerical Worker	68 Psychiatrist
19	19 Manager	69 Health Records Clerk
20	20 Analyst	70 Desktop Support Technician
21	21 System Administrator	71 Dispenser
22	22 Desktop Support Administrator	72 Clinical Assistant
23	23 System Worker	73 Practitioner
24	24 GP Registrar	74 Information Officer
25	25 Medical Student	75 Network Administrator
26	26 Other Community Health Service - Admin Clerk	76 Chaplain
27	27 Specialist Nurse Practitioner	77 Student Physiotherapist
28	28 Receptionist	78 Paramedic Specialist Practitioner
29	29 Secretary	79 Clinical Team Manager
30	30 Medical Secretary	80 Physiotherapist Specialist Practitioner
31	31 Sessional GP	81 Helpdesk Technician
32	32 Clinical Application Administrator	82 Radiographer
33	33 Nurse Consultant	83 Other Community Health Service
34	34 Physiotherapist	84 Call Operator
35	35 Specialist Practitioner	85 Community Worker (children)
36	36 Healthcare Assistant	86 Paramedic Consultant
37	37 Medical Technical Officer - Pharmacy	87 Associate Practitioner
38	38 Health Records Administrator	88 Modern Matron
39	39 Helpdesk Administrator	89 Asst. Clinical Medical Officer
40	40 Appointments Clerk	90 Community Team Manager
41	41 Senior House Officer	91 Specialist Registrar
42	42 Social Worker	92 Chiropodist/Podiatrist Manager
43	43 Trainee Practitioner	93 Radiographer - Therapeutic, Manager
44	44 Network Technician	94 Optometrist
45	45 Clinical Coder	95 Assistant Practitioner
46	46 Medical Records Clerk	96 Community Learning Disabilities Nurse
47	47 Staff Nurse	97 Technician - Additional Clinical Services
48	48 Enrolled Nurse	98 Student Health Visitor
49	49 Multi Therapist	99 Interpreter
50	50 Nursery Nurse	100 Medical Technical Officer

Annex 3: NHS targets for cancer wait times

		Operational standard	
Maximum two weeks from	Receipt of urgent referral for suspected cancer to first outpatient attendance	93%	
	Receipt of referral of any patient with breast symptoms (where cancer not suspected) to first hospital assessment	93%	
Maximum 28 days from	Receipt of two week wait referral for suspected cancer, receipt of urgent referral from a cancer screening programme (breast, bowel, cervical), and receipt of two week wait referral of any patient with breast symptoms (where cancer not suspected), to the date the patient is informed of a diagnosis or ruling out of cancer	75%	
Maximum one month (31 days) from:	Decision to treat to first definitive treatment	96%	
	Decision to treat/earliest clinically appropriate date to start of second or subsequent treatment(s) for all cancer patients including those diagnosed with a recurrence where the subsequent treatment is:	surgery	94%
		drug treatment	98%
		radiotherapy	94%
Maximum two months (62 days) from:	Urgent referral for suspected cancer to first treatment (62-day classic)	85%	
	Urgent referral from a NHS Cancer Screening Programme (breast, cervical or bowel) for suspected cancer to first treatment	90%	

Annex 4: Comparing Cancer Wait Times counts for referrals and first treatments with the NCRAS data equity pack

Table A4.1: Comparing Cancer Wait Times counts for referrals and first treatments with the NCRAS data equity pack

Cancer wait times data	01 Apr 2020 - 31 Jan 2021					
	First treatments for new cancer			Urgent cancer referrals		
	Observed	Expected	Percentage change (95% CI)	Observed	Expected	Percentage change (95% CI)
All	224,323	267,946	-16.3% (-16.6, -15.9)	1,673,775	2,071,967	-19.2% (-19.3, -19.1)
NCRAS data equity pack						
All	219,410	254,436	-13.8% (-14.3, -13.3)	1,658,309	1,984,489	-16.4% (-16.6, -16.3)
Breast	30,488	40,530	-24.8% (-25.9, -23.6)	337,582	363,139	-7% (-7.5, -6.6)
Gynaecological	11,281	12,344	-8.6% (-10.9, -6.2)	158,723	176,985	-10.3% (-10.9, -9.7)
Head and Neck	8,892	9,901	-10.2% (-12.7, -7.6)	163,668	189,837	-13.8% (-14.4, -13.2)
Lower GI	23,507	27,056	-13.1% (-14.6, -11.6)	302,369	366,677	-17.5% (-17.9, -17.1)
Lung	24,796	27,409	-9.5% (-11.1, -8.0)	33,830	53,641	-36.9% (-37.8, -36.1)
Skin	40,977	43,475	-5.7% (-7.0, -4.5)	338,172	429,802	-21.3% (-21.7, -21.0)
Upper GI	17,059	17,586	-3% (-5.0, -0.9)	141,720	163,013	-13.1% (-13.7, -12.4)
Urological	37,970	50,056	-24.1% (-25.2, -23.1)	134,389	184,642	-27.2% (-27.7, -26.7)
All other	24,441	26,080	-6.3% (-7.9, -4.6)	47,856	56,753	-15.7% (-16.7, -14.6)

Annex 5: Patient demographics and person-time and total numbers of observed activity in CPRD Aurum sample

Table A5.1: Patient demographics in CPRD Aurum sample as at 22 March 2020

	Patient count as at 22 March 2020	
	n	%
All	375,501	
Female	187,509	49.9%
Male	187,992	50.1%
Under 11	39,611	10.5%
11 to 19	43,406	11.6%
20 to 49	157,962	42.1%
50 to 69	87,482	23.3%
70 and older	47,040	12.5%
IMD Quintile - 1	78,759	21.0%
IMD Quintile - 2	73,046	19.5%
IMD Quintile - 3	71,840	19.1%
IMD Quintile - 4	77,545	20.7%
IMD Quintile - 5	74,020	19.7%
IMD not recorded	291	0.1%

Table A5.2: Person time (weeks) and total primary care activity analysed - CPRD Aurum

	3 January 2016 - 21 March 2020*			22 March 2020 - 30 January 2021				
	Patient-time (weeks)	100,000 person-months	Activity count	Observed rate per 100,000 person-months	Patient-time (weeks)	100,000 person-months	Activity count	Observed rate per 100,000 person-months
Consultations excl flu vaccinations	78,868,977	181.44	6,912,079	38,095	16,701,707	38.19	1,306,206	34,201
Routine Referrals	78,868,977	181.44	312,422	1,722	16,701,707	38.19	40,744	1,067
2 Week Wait Referrals	78,868,977	181.44	38,905	214	16,701,707	38.19	10,235	268

*The pre-pandemic period consists of 220 weeks or 51.61 months, the post pandemic period is 45 weeks or 10.29 months

Annex 6: Observed vs expected appointment and cancer diagnosis counts from CWT data from 01 Jan 2019 (per person-month)

STROBE Statement—checklist of items that should be included in reports of observational studies

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	3
Objectives	3	State specific objectives, including any prespecified hypotheses	3
Methods			
Study design	4	Present key elements of study design early in the paper	4
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	4
Participants	6	(a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants	4
		(b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case	
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	4/5
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	4/5
Bias	9	Describe any efforts to address potential sources of bias	5/6
Study size	10	Explain how the study size was arrived at	4
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	4-6
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	5/6
		(b) Describe any methods used to examine subgroups and interactions	5/6
		(c) Explain how missing data were addressed	4-6
		(d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy	N/A
		(e) Describe any sensitivity analyses	4-6

Continued on next page

Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	4/5
		(b) Give reasons for non-participation at each stage	N/A
		(c) Consider use of a flow diagram	N/A
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	6-8
		(b) Indicate number of participants with missing data for each variable of interest	6-8
		(c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount)	N/A
Outcome data	15*	<i>Cohort study</i> —Report numbers of outcome events or summary measures over time	6/7
		<i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure	N/A
		<i>Cross-sectional study</i> —Report numbers of outcome events or summary measures	N/A
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	6-8
		(b) Report category boundaries when continuous variables were categorized	N/A
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	N/A
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	6-8
Discussion			
Key results	18	Summarise key results with reference to study objectives	9
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	9/10
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	10
Generalisability	21	Discuss the generalisability (external validity) of the study results	9/10
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	1

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.
