

Figure S3. Differences in length or thickness of different ileum histological structures in non-immunized (NI) and immunized (Experimental Autoimmune Uveitis) mice receiving water or treated with methotrexate (MTX) or mycophenolate mofetil (MMF). (A) Histopathological differences among groups; Representative examples of immunized mice receiving water (B), MTX-treated mice (C), and MMF-treated mice (D). Hematoxylin & eosin, 10x. m, muscularis; s, submucosa; c, crypt; v, villi. * $p < 0.05$. $n = 3-9$ mice per group (non-immunized), and 8-24 mice per group (immunized). Time-point = 6 weeks post-treatment initiation, 2 weeks post-immunization.
