

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

48 ABSTRACT

49 **Introduction:** Infections caused by carbapenemase-producing *Enterobacterales* are frequent
50 and associated with high rates of mortality. Intestinal carriers are at increased risk of infection
51 by these microorganisms. Decolonization strategies with antibiotics have not obtained
52 conclusive results. Fecal microbiota transplantation (FMT) could be an effective and safe
53 strategy to decolonize intestinal carriers of KPC-producing *Klebsiella pneumoniae* (KPC-Kp) but
54 this hypothesis needs evaluation in appropriate clinical trials.

56 **Methods and analysis:** The KAPEDIS trial is a single-center, randomized, double-blind, placebo-
57 controlled, phase 2, superiority clinical trial of FMT for eradication of intestinal colonization by
58 KPC-Kp. One hundred and twenty patients with rectal colonization by KPC-Kp will be randomized
59 1:1 to receive encapsulated lyophilized FMT or placebo. The primary outcome is KPC-Kp
60 eradication at 30 days. Secondary outcomes are: (i) frequency of adverse events; (ii) changes in
61 KPC-Kp relative load within the intestinal microbiota at 7, 30 and 90 days, estimated by real-
62 time quantitative PCR analysis of rectal swab samples; and (iii) rates of persistent eradication,
63 KPC-Kp infection and crude mortality at 90 days. Participants will be monitored for adverse
64 effects throughout the intervention.

66 **Ethics and dissemination:** Ethical approval was obtained from Reina Sofia University Hospital
67 Institutional Review Board (2019-003808-13). Trial results will be published in peer-reviewed
68 journals and disseminated at national and international conferences.

70 **Trial registration number:** Clinicaltrials.gov registration number NCT04760665.

1
2
3 **73 STRENGTHS AND LIMITATIONS OF THIS STUDY**
4

- 5
6 74 1. The double-blind, randomized, placebo-controlled design will control for spontaneous KPC-
7
8 75 Kp decolonization.
9
10 76 2. A remote, centralized, automatic randomization system together with double-blinding will
11
12 77 be implemented to reduce sources of potential bias.
13
14 78 3. The trial is designed to evaluate the superiority of FMT against placebo in preventing
15
16 79 multidrug-resistant infections.
17
18 80 4. Concomitant administration of antibiotics during the follow-up period could act as
19
20 81 confounder.
21
22 82 5. The double-blind design is a strength of the study, while the single-center design is a
23
24 83 limitation.

92 INTRODUCTION

93 Multidrug-resistant bacteria represent an important threat to public health and
94 particularly to vulnerable patient populations such as the elderly, the chronically ill,
95 hospitalized patients, transplant and immunosuppressed recipients [1–3]. *Enterobacterales* are
96 especially important from an antimicrobial resistance perspective, since they are a common
97 cause of community-associated, as well as healthcare-associated infections. Carbapenem-
98 resistant *Enterobacterales* (CRE) have been designated as a critical priority in the World Health
99 Organization (WHO) Global Priority List for antimicrobial-resistant bacteria for the
100 development of new antibiotics.

101 The gastrointestinal tract is a reservoir for antibiotic-resistant pathogens that cause
102 disease by a variety of mechanisms. There is increasing evidence that the commensal
103 microbiota have an indirect role in the control of pathogen invasion by stimulating host
104 immunity in the intestines [4]. Antibiotic treatment drastically alters the composition of the
105 microbiota, interfering with this immunological balance, and promoting selection and
106 proliferation of antibiotic-resistant pathogens. Conversely, the commensal microbiota may be
107 manipulated to prevent or cure infections caused by pathogenic bacteria, particularly
108 multidrug-resistant organisms (MDRO) such as vancomycin-resistant *Enterococcus faecium*,
109 Gram-negative *Enterobacterales*, and *Clostridium difficile* [4,5]. So far, the most common
110 control strategy for prevention of CRE infection in colonized patients is selective intestinal
111 decolonization (SDD) with oral, non-absorbable antibiotics, including colistin and
112 aminoglycosides [6–10]. The reported decolonization rates in observational studies range
113 between 27.5% and 71% [10,11]. However, development of resistance to decolonizing agents
114 is frequently reported and there is a lack of randomized clinical trials (RCT) that allow adequate
115 assessment of the effectiveness and safety of this strategy. Considering these limitations, the
116 clinical guidelines from the European Society of Clinical Microbiology and Infectious Diseases

1
2
3 117 and European Committee on Infection Control (ESCMID-ECIC) do not recommend routine SDD
4
5 118 of CRE carriers [10].
6

7 119 Fecal microbiota transplantation (FMT) is an antibiotic-free decolonization strategy
8
9 120 which has been demonstrated to be highly effective for treatment of recurrent *Clostridioides*
10
11 121 *difficile* infections (CDI) [5]. It involves administration of fecal material containing distal gut
12
13 122 microbiota from a healthy person (donor) to a patient with a disease or condition related to
14
15 123 dysbiosis or alterations in the balance of their commensal microbiota. Recently, FMT has
16
17 124 received attention as a potential decolonization strategy for MDRO [12–19]. So far, a single
18
19 125 randomized control trial (RCT) has evaluated whether oral antibiotics followed by FMT could
20
21 126 eradicate intestinal carriage with extended-spectrum beta-lactamase-producing
22
23 127 *Enterobacterales* (ESBL-E, 72% of patients) or carbapenemase-producing *Enterobacterales* (CPE,
24
25 128 28% of patients) [14]. The study failed to show non-inferiority of FMT, however, there were
26
27 129 important limitations, including the lack of a placebo control, and failure to reach the targeted
28
29 130 number of patients due to legislative impediments [14]. Besides this RCT, a recent meta-analysis
30
31 131 evaluated five European studies (three case series and two case reports), and reported an
32
33 132 overall 46% successful decolonization rate at one month after FMT, with higher decolonization
34
35 133 rates for *P. aeruginosa* (100% decolonization in 4 cases) as compared to NDM-1-producing
36
37 134 *Klebsiella pneumoniae* (36.4%) and ESBL-producing *Klebsiella pneumoniae* (40%) [20]. In
38
39 135 contrast, a recent prospective cohort study including 15 CPE carriers reported 60% eradication
40
41 136 rates at one month after FMT [18]. In this study, *Klebsiella pneumoniae* was the most common
42
43 137 species (7/15) and *blaKPC* was the most common carbapenemase gene (9/15), followed by
44
45 138 *blaOXA-48* (5/15) and *blaNDM* (1/15) [18]. The observed differences in effectiveness of FMT for
46
47 139 eradication of MDRO may be explained by differences in FMT conditions among studies,
48
49 140 including bowel preparation before FMT, the donor, the dose, and FMT preparation and
50
51 141 administration procedures. Importantly, overall, studies report minor adverse events in patients
52
53
54
55
56
57
58
59

BMJ Open_KAPEDIS

1
2
3 142 who received FMT for MDRO eradication, and these include vomiting, diarrhea, abdominal pain,
4
5 143 and ileus [20,21].
6

7 144 Despite all the limitations, the available evidence suggests a potential benefit of FMT as
8
9 145 a decolonization intervention for CRE, however this needs to be confirmed by future well-
10
11 146 designed RCTs. We have designed a phase II, double-blind, placebo-controlled clinical trial to
12
13 147 assess the efficacy of oral FMT capsules to eradicate colonization, with KPC carbapenemase-
14
15 148 producing *Klebsiella pneumoniae* (KPC-Kp).

19
20
21

22 150 **METHODS AND ANALYSIS**

23 151 **TRIAL DESIGN AND STUDY SETTING**

24
25
26
27 152 Randomized, double-blind, placebo-controlled, phase 2, superiority clinical trial with two
28
29 153 parallel arms: 120 patients will be randomized 1:1 to receive FMT capsules (N=60) or placebo
30
31 154 (N=60) (**Figure 1**). Participants will be recruited from Reina Sofía University Hospital, a 1000-bed
32
33 155 tertiary, academic, public hospital located in Córdoba, Spain. Some patients may be hospitalized
34
35 156 at the time of recruitment and will thus be included during hospital stay. Participants who are
36
37 157 not hospitalized or are discharged from hospital will be invited to attend the outpatient clinic.
38
39 158 We followed SPIRIT (Standard Protocol Items: Recommendations for Interventional Trials)
40
41 159 guidance, outlined in a 33-item checklist (**Annex 1**) and **Figure 1** [22].
42
43
44
45
46
47

48 161 **Primary objective**

- 49
50
51 162 • To assess the efficacy of oral FMT capsules to eradicate intestinal colonization by KPC-
52
53 163 producing *Klebsiella pneumoniae* at 30 days after FMT.
54
55
56
57
58
59
60

1
2
3 165 **Primary outcome**
4
5

- 6 166 • KPC-Kp eradication at 30 days in the intention-to-treat population, including all randomized
7
8 167 patients.
9
10

11 168

12
13
14 169 **Secondary objectives**
15

- 16
17 170 • To evaluate the safety of FMT.
18
19 171 • To determine if FMT is associated with an early (7 days post-FMT) and late (30 days post-
20
21 172 FMT) decrease in the relative load of KPC-Kp within the intestinal microbiota.
22
23 173 • To evaluate if FMT is associated with persistent intestinal eradication at 3 months after
24
25 174 intervention.
26
27 175 • To study if FMT is associated with a decrease in the incidence of KPC-Kp infections at 3
28
29 176 months after intervention.
30
31 177 • To evaluate if FMT is associated with a decrease in mortality due to KPC-Kp infections at 3
32
33 178 months after intervention.
34
35

36 179

37
38
39
40 180 **Secondary outcomes**
41

- 42
43 181 • Proportion of patients with adverse events during follow-up: (i) reflux following FMT
44
45 182 administration; (ii) intolerable gastrointestinal side effects (i.e. abdominal pain, flatulence,
46
47 183 vomiting, constipation, diarrhoea or transient fever) leading to discontinuation of FMT
48
49 184 before completing the study; (iii) occurrence of any adverse/serious adverse effects.
50
51 185 • Changes in the relative load of KPC-Kp within the intestinal microbiota from day 0 (baseline)
52
53 186 to days 7 (visit 1), 30 (visit 2) and 90 (visit 3), estimated by quantitative real-time PCR analysis
54
55 187 (qPCR) of rectal swab samples (described below).
56
57 188 • Proportion of patients with persistent KPC-Kp eradication at 3 months of follow-up.
58
59
60

BMJ Open_KAPEDIS

1
2
3 189 • Rate of KPC-Kp infections at 3 months.
4

5 190 • Crude mortality rate at 3 months.
6
7
8 191
9

10 192 **Definitions**
11
12
13

14 193 • Eradication: Negative rectal swab culture for KPC-Kp together with negative polymerase
15
16 194 chain reaction (PCR) test for *bla_{KPC}* gene. If the PCR result is positive, the subject is
17
18 195 considered not-decolonized.
19

20 196 • Early decrease in intestinal KPC-Kp load: Significant reduction in the relative load of KPC-Kp
21
22 197 within the gut microbiota in rectal swab samples obtained at day 7 of follow-up (visit 2) in
23
24 198 patients receiving FMT versus placebo.
25
26

27 199 • Late decrease in intestinal KPC-Kp load: Significant reduction in the relative load of KPC-Kp
28
29 200 within the gut microbiota in rectal swab samples obtained at day 30 of follow-up (visit 3)
30
31 201 in patients receiving FMT versus placebo.
32
33

34 202 • Early decolonization: Negative rectal swab culture for KPC-Kp and negative polymerase
35
36 203 chain reaction (PCR) test for *bla_{KPC}* gene within 7-10 days of intervention.
37
38

39 204 • Persistent decolonization: Negative rectal swab culture for KPC-Kp and
40
41 205 negative polymerase chain reaction (PCR) test for *bla_{KPC}* gene on days 30 and 90 after the
42
43 206 intervention.
44

45 207 • KPC-Kp infection: i) Proven infection: KPC-Kp isolated from clinical specimens in the
46
47 208 presence of clinical signs and symptoms of infection; ii) Probable infection: presence of
48
49 209 clinical signs and symptoms of infection requiring treatment against KPC-Kp at the
50
51 210 discretion of the attending physician, without isolation of KPC-Kp from clinical specimens.
52
53

54 211 • Crude mortality: All-cause mortality during follow-up.
55

56 212 • Intention-To-Treat (ITT) population: all randomized patients.
57
58
59
60

- 1
2
3 213 • Per protocol population (PPP): Patients who meet the following criteria: (i) having been
4
5 214 randomized; (ii) complete data for the primary objective; (iii) not having received
6
7 215 antibiotics between randomization and visit 3.
8
9
10 216 • Microbiologically evaluable population (PME): patients in whom all rectal colonization
11
12 217 studies have been performed during follow-up.
13
14
15 218

219 Eligibility criteria

220 Inclusion criteria:

- 221 • Adult current or previous patients at Reina Sofía University Hospital with a positive rectal
222 swab for KPC-Kp within one week before randomization.
223 • The participant or legal representative must be able to provide written informed consent.
224 • Absence of KPC-Kp clinical samples at the time of informed consent and in the previous
225 month.
226

227 Exclusion criteria:

- 228 • Terminal illness or life expectancy of 3 months or less.
229 • Pregnancy or breastfeeding.
230 • Inability/unwillingness to orally ingest study medication.
231 • Dysphagia and aspiration disorders.
232 • A history of colectomy, colostomy, or ileostomy.
233 • Patients who have been treated with antibiotics within 30 days prior to consent.
234 • Absolute neutrophil count $< 500/\text{mm}^3$.
235 • Planned myelosuppressive chemotherapy within 30 days of randomization, i.e.
236 dexamethasone, chemotherapy against solid tumors or prior to hematopoietic stem cell
237 transplant (HSCT).

BMJ Open_KAPEDIS

- 1
2
3 238 • HSCT within 30 days prior to consent.
4
5 239 • Clinical symptoms and signs of mucositis.
6
7
8 240 • Major abdominal surgery within the upcoming 30 days.
9
10 241 • Patients with Giannella Risk Score > 12 puntos [23].
11
12 242 • Selective Digestive Decolonization with oral antibiotics within 3 months prior to
13
14 243 randomization.
15
16
17 244 • Severe food allergy.
18
19 245

246 **Microbiological studies**

247 Rectal swab samples will be analysed for the presence of CPE, using both culture on
248 selective chromogenic agar plates (CHROMID® CARBA, bioMérieux, Marcy-l'Étoile, France), and
249 quantitative real-time PCR.

250 For bacteria grown on culture, identification will be performed using MALDI- TOF mass
251 spectrometry (Bruker, Germany) and carbapenemase production will be evaluated by a multiple
252 strategy: (1) Antimicrobial susceptibility testing, with a first step using the commercial system
253 MicroScan WalkAway and NC53 broth microdilution panels (Beckman Coulter, USA), and a
254 second step, when a KPC-producing *K. pneumoniae* is identified, determining the MICs of
255 ertapenem, imipenem, meropenem and other relevant agents (including ceftolozane-
256 tazobactam, ceftazidime-avibactam, imipenem-relebactam and meropenem-vaborbactam
257 cefiderocol, fosfomycin, colistin, eravacycline) using EUMDROXF microdilution panels
258 (Sensititre™, Thermofisher, USA); clinical categories will be defined according to EUCAST
259 breakpoints; (2) the Modified Carbapenem Inactivation Method, using meropenem discs [24];
260 (3) an immunochromatography test for the independent identification of OXA-48[-like], KPC,
261 NDM, IMP and VIM families of carbapenemases (NG-Test CARBA 5; NG Biotech, Guipry, France)
262 and (4) conventional PCR for detection of the complete *blaKPC* gene, complemented with

1
2
3 263 sequencing of the two DNA strands of corresponding amplicon when a positive result is
4
5 264 obtained.

6
7
8 265 Quantification of the intestinal load of *blaKPC* gene in rectal swabs will be performed by
9
10 266 quantitative real-time PCR. The load will be calculated relative to the total bacterial population
11
12 267 (represented by the 16S rRNA gene) using the $\Delta\Delta C_t$ method and pure cultures of KPC-producing
13
14
15 268 *K. pneumoniae* as reference standards, as described in [25,26].
16
17

18 269

20 270 **Interventions**

22 271 Trial interventions

23
24
25 272 Patients will be randomised 1:1 to receive oral capsules containing TMF or placebo.
26
27 273 Mikrobiomik Healthcare Company S.L. (Vizcaya, Spain) will supply the FMT product (MBK-01),
28
29 274 which consists of lyophilised microbiota encapsulated in hypromellose capsules (size 0), with a
30
31 275 median mass of 250 g per capsule. Treatment will consist of a batch of 4 capsules, containing 1
32
33 276 g of lyophilized microbiota with $\geq 2 \times 10^{11}$ total bacterial cells, obtained from a minimum of 30
34
35 277 g donor feces. Participants in the placebo arm will receive 4 capsules containing microcrystalline
36
37 278 cellulose with the same shape, size and weight. The company will also supply the empty
38
39 279 capsules to which the placebo will be added at the Pharmacy Service in our hospital. Capsules
40
41 280 will be stored, with desiccant, at a temperature of $5 \pm 3^\circ\text{C}$, until they are dispensed.
42
43 281 Mikrobiomik Healthcare Company will guarantee the traceability of the capsules and a record
44
45 282 will be made of their storage, dispensing and destruction. Treatment will be dispensed to trial
46
47 283 participants in presence of a member of the research team in a single dose in one day.
48
49
50

51 284

52 285 Concomitant care and interventions

53
54
55 286 Patients will fast for 12 hours and will receive a laxative preparation (one macrogol 3350,
56
57 287 Movicol 13.8 g[®] sachet dissolved in 125 ml water) the day before study intervention. The
58
59
60

BMJ Open_KAPEDIS

1
2
3 288 concomitant use of systemic antibiotics with activity against KPC-Kp at the time of intervention
4
5 289 will not be allowed. Administration of these antibiotics during the study will be considered a
6
7 290 proven or probable infection. During the follow-up period, administration of other
8
9 291 decolonization guidelines will not be allowed either. Other non-excluded drugs will be allowed.
10
11
12 292

13
14
15 293 **Assignment of interventions**

16
17
18 294 Allocation to treatment arms will be performed using a centralized, web-based
19
20 295 automated randomization system, integrated with the electronic case report file (eCRF), and
21
22 296 will be hosted by Maimonides Institute for Biomedical Research of Cordoba (Cordoba, Spain).
23
24 297 After the patient's enrolment is confirmed, the randomization specialist will assign a computer-
25
26 298 generated random number to each patient. The randomization data will be sent to a designated
27
28 299 mailbox, and the responsible nurse will collect the treatment from the pharmacy at the hospital
29
30 300 according to the assigned results. A double-blinded design will be used in this study for the
31
32 301 physicians and statistical specialists, and patients and research assistants. However, the
33
34 302 pharmacist will know the group of each patient. The allocation of the participants' treatment
35
36 303 may be revealed at the end of the data analysis.
37
38
39
40
41 304

42
43 305 **Evaluation during and after treatment**

44
45
46 306 All patients will be followed for 90 days (± 5 days) after the intervention or until death.
47
48 307 Four follow-up visits will be scheduled for all participants at day 0 (baseline), day 7–10 (visit 1);
49
50 308 day 30 ± 4 (visit 2), and day 90 ± 5 (visit 3) after end of intervention. The procedures that will be
51
52 309 performed at each visit are indicated in **Figure 1**. A rectal swab sample will be obtained at each
53
54 310 visit for colonization studies and quantification of KPC-Kp load by qPCR (see below). If a
55
56 311 participant fails to be present at a scheduled visit, all attempts to contact them and any
57
58 312 retrieved information will be recorded. A minimum of three documented contact attempts via
59
60

1
2
3 313 phone calls will be performed, on separate occasions. All data collected will be included in an
4
5 314 electronic database specifically designed for this study, with password-protected user
6
7 315 authentication. To ensure the quality of the data, independent audits from investigators and
8
9 316 sponsors may be carried out at any moment of the study.
10
11
12
13
14

15 318 **Adverse effects**

16
17
18 319 Adverse effects will be recorded and reported as part of routine follow-up. All events
19
20 320 fulfilling the criteria of a serious adverse event that occur during the period of study will be
21
22 321 reported to the promoter within 24 hours post event occurrence. An insurance policy will be
23
24 322 contracted to cover any harm from trial participation.
25
26
27
28
29

30 323 31 324 **Sample size calculation**

32
33
34 325 Sample size calculation was performed with G*Power 3.1 program
35
36 326 (<https://gpower.software.informer.com/3.1/>), assuming the following estimates: 90% power;
37
38 327 5% alpha error; decolonization rate at 30 days of 30% in the control group and 60% in the
39
40 328 experimental group; 1:1 treatment to placebo ratio; superiority considered if the confidence
41
42 329 interval lower bound for the difference between decolonization rates in the experimental and
43
44 330 control groups is greater than 5%; and expected informed consent rate of 40%. The estimated
45
46 331 decolonization rate in patients treated with FMT has been obtained from a recently published
47
48 332 study [16] . The proportion of decolonized patients in the control group was obtained from a
49
50 333 previous prospective observational cohort in our center of patients with intestinal colonization
51
52 334 by KPC-Kp (KLEBCOM study, unpublished results). With these considerations, the sample size
53
54 335 results in 112 patients. We added 7% more patients in order to account for possible loss to
55
56 336 follow-up, resulting in a final sample size of 120 patients (60 patients in the experimental group
57
58
59
60

BMJ Open_KAPEDIS

337 and 60 patients in the control group). To reach the sample size, we will perform active
338 surveillance of patients with KPC-Kp isolated from microbiological samples in our hospital.

339

340 Withdrawal from study

341 In accordance with the Declaration of Helsinki, patients have the right to withdraw from
342 the study at any time and for any reason, communicating this decision personally or through
343 their representative. The study withdrawal criteria will be the following: a) at the request of the
344 patient, through withdrawal of informed consent; b) when the patient no longer complies with
345 protocol indications (protocol deviation); c) as a result of any adverse event, regardless of its
346 intensity, at the discretion of the investigator; d) when for any reason the treatment is no longer
347 safe for the patient; e) as a result of an administrative decision taken by the researchers,
348 sponsor, or regulatory authority; f) as a result of loss of contact during follow-up. If a patient is
349 withdrawn from the trial prematurely, the investigator will register the main reason for the
350 withdrawal in the Clinical Research File. Whenever necessary, the patient will continue to be
351 followed, according to the standard protocols for treatment of their pathology, at the discretion
352 of the responsible physician.

353

354 Statistical analysis

355 Frequencies and percentages of categorical variables, and median and interquartile
356 ranges of continuous variables will be described. Comparisons will be performed using Chi-
357 square or Fisher's test for categorical variables, and Student's T or Mann-Whitney U test for
358 normally and not-normally distributed continuous variables, respectively.

359 The absolute difference in the percentages of decolonization between the patients in
360 the experimental and control groups, and its 95% confidence interval, will be calculated.
361 Clinically significant superiority will be considered if the 95% confidence interval lower bound is

1
2
3 362 greater than 5%. For the primary and secondary endpoints, the main analyses will be carried out
4
5 363 in the intention-to-treat (ITT) population. Then, an analysis will also be carried out in the per-
6
7 364 protocol (PP) population (see definitions). All analyses will be performed using IBM SPSS
8
9 365 Statistics software.
10
11
12 366

15 367 **ETHICS AND DISSEMINATION**

17
18 368 The study is funded by Instituto de Salud Carlos III (Science and Innovation Ministry,
19
20 369 Spanish government). It was authorized and approved by the ethical review board. Consent to
21
22 370 participate will be obtained from all participants prior to the start of the trial by physicians
23
24 371 included in our research team. The informed consent is provided as **Annex 2**. All data will be
25
26 372 anonymized. The study is being conducted in compliance with the protocol, regulatory
27
28 373 requirements, International Council of Harmonization (ICH) E6 Good Clinical Practice and the
29
30 374 ethical principles of the latest version of the Declaration of Helsinki, as adopted by the World
31
32 375 Medical Association. Each substantial protocol amendment will be notified for approval to the
33
34 376 relevant ethics committee(s) prior to implementation. The trial is registered with
35
36 377 ClinicalTrials.gov as NCT04760665 (February 18, 2021). All data collected will be kept strictly
37
38 378 confidential and in accordance with all relevant legislation on control and protection of personal
39
40 379 information. The participants will be identified on documentation by a unique ID number, not
41
42 380 by name, in agreement with the European Regulation on data protection (EU 2016/679). All
43
44 381 study-related information will be stored securely. The final results will be publicly disseminated
45
46 382 regardless of the study outcomes. The results of this study will be published in peer-reviewed
47
48 383 journals, as well as national and international conferences.
49
50
51
52 384

57 385 **Patient and public involvement**

9

10
11 389 **DISCUSSION**
12

13 390 In recent years there has been a significant increase in the frequency of infections
14
15 391 caused by carbapenem-producing *Enterobacterales* (CRE). These infections are associated with
16
17 392 high mortality rates as a result of the difficulty in initiating effective empirical treatment and
18
19 393 the limited therapeutic alternatives available for targeted treatment [27,28]. Rectal
20
21 394 colonization with CRE has previously been identified as an important risk factor for the
22
23 395 development of subsequent CRE infection [9,23,29,30]. This situation has promoted efforts to
24
25 396 prevent the acquisition and spread of these bacteria, including development of novel
26
27 397 decolonization strategies.
28
29

30
31 398 The utility of fecal microbiota transplantation (FMT) for gut decolonization of multidrug
32
33 399 resistant organisms (MDROs) has been explored in several case reports, one prospective
34
35 400 observational cohort and one RCT, summarized in a number of systematic reviews and
36
37 401 metanalysis [18,20,21,31,32]. The only RCT, conducted by the R-GNOSIS study group, tested
38
39 402 the efficacy of frozen capsulized FMT following a 5-day course of oral antibiotics in 39 carriers
40
41 403 of extended spectrum β -lactamase *Enterobacterales* (ESBL-E) and carbapenemase-producing
42
43 404 *Enterobacterales* (CPE) [14]. The desirability of pre-FMT antibiotic therapy in the context of
44
45 405 MDRO decolonization is unclear. Firstly, the administration of antibiotics renders it very difficult
46
47 406 to unravel the independent contributions of antibiotics and FMT to CRE decolonization.
48
49 407 Secondly, pre-clinical studies with mouse models suggest that antibiotic pre-conditioning may
50
51 408 improve the engraftment of specific taxa but not the overall engraftment of donor microbiota
52
53 409 in the recipient mice [33,34]. Bar-Yoseph *et al* [18] reported that the use of antibiotics in the
54
55 410 post-FMT period interfered with FMT engraftment among CPE-colonized recipients [18].
56
57
58
59
60

1
2
3 411 In this RCT, patients will be receiving FMT based on lyophilized oral capsules, which have
4
5 412 been proven non-inferior to colonoscopy for the treatment of recurrent CDI and which also have
6
7 413 higher acceptance by patients (Kao et al. 2017). Further, patients with CPE colonization who
8
9 414 receive oral capsulized FMT achieved high eradication success (60%) at one month [18]. In
10
11 415 addition, using lyophilized preparations facilitates capsule handling and stability, making it more
12
13 416 feasible in hospital routine.

14
15
16 417 Regarding the amount of starting stool material, the European Consensus Conference
17
18 418 on Faecal Microbiota Transplantation in Clinical Practice for the treatment of *Clostridium*
19
20 419 *difficile* infection (CDI) recommends a minimum of 30 g for the treatment of recurrent *CDI* [35].
21
22 420 Nevertheless, the optimal dose in FMT remains unclear since no randomized trials have
23
24 421 compared different amounts of faecal matter so far. In the present RCT, the capsules with the
25
26 422 lyophilized FMT material will be provided by an external company, which has been legally
27
28 423 authorized for production of the FMT capsules by the Spanish Agency for Medications and
29
30 424 Healthcare Products (AEMPS). The company will guarantee that each treatment, consisting of a
31
32 425 batch of 4 capsules, will contain a minimum of 2×10^{11} total bacterial cells obtained from a
33
34 426 minimum of 30 g of feces.

35
36
37 427 The overall aim of this RCT is to evaluate the efficacy and safety of FMT for sustained
38
39 428 eradication of CPE without using antibiotics that could impact the viability of the FMT content
40
41 429 or confound results. It has been designed with placebo control to allow estimation of the
42
43 430 contribution of spontaneous decolonization to CPE eradication. If the efficacy and safety of FMT
44
45 431 are proven, FMT may be considered a better approach for decolonization of gut MDRO than
46
47 432 selective antibiotics decolonization, with lower ecological impact, and potentially reducing the
48
49 433 risk of subsequent infections.

Annex 1. SPIRIT 2013 Checklist: Recommended items to address in a clinical trial protocol and related documents.

Section/item	Item No	Description	Page in the document
Administrative information			
Title	1	Descriptive title identifying the study design, population, interventions, and, if applicable, trial acronym	1
Trial registration	2a	Trial identifier and registry name. If not yet registered, name of intended registry	3
	2b	All items from the World Health Organization Trial Registration Data Set	--
Protocol version	3	Date and version identifier	24
Funding	4	Sources and types of financial, material, and other support	24
Roles and responsibilities	5a	Names, affiliations, and roles of protocol contributors	1, 24
	5b	Name and contact information for the trial sponsor	--
	5c	Role of study sponsor and funders, if any, in study design; collection, management, analysis, and interpretation of data; writing of the report; and the decision to submit the report for publication, including whether they will have ultimate authority over any of these activities	24
	5d	Composition, roles, and responsibilities of the coordinating centre, steering committee, endpoint adjudication committee, data management team, and other individuals or groups overseeing the trial, if applicable (see Item 21a for data monitoring committee)	--
Introduction			
Background and rationale	6a	Description of research question and justification for undertaking the trial, including summary of relevant studies (published and unpublished) examining benefits and harms for each intervention	5-7
	6b	Explanation for choice of comparators	5-7
Objectives	7	Specific objectives or hypotheses	7,8
Trial design	8	Description of trial design including type of trial (e.g., parallel group, crossover, factorial, single group), allocation ratio, and framework (e.g., superiority, equivalence, noninferiority, exploratory)	7
Methods: Participants, interventions, and outcomes			
Study setting	9	Description of study settings (e.g., community clinic, academic hospital) and list of countries where data will be collected. Reference to where list of study sites can be obtained	7
Eligibility criteria	10	Inclusion and exclusion criteria for participants. If applicable, eligibility criteria for study centres and individuals who will perform the interventions (e.g., surgeons, psychotherapists)	10-11
Interventions	11a	Interventions for each group with sufficient detail to allow replication, including how and when they will be administered	12-13
	11b	Criteria for discontinuing or modifying allocated interventions for a given trial participant (e.g., drug dose change in response to harms, participant request, or improving/worsening disease)	14-15
	11c	Strategies to improve adherence to intervention protocols, and any procedures for monitoring adherence (e.g., drug tablet return, laboratory tests)	12, Figure 1
	11d	Relevant concomitant care and interventions that are permitted or prohibited during the trial	10-13

1				
2				
3				
4				
5	Outcomes	12	Primary, secondary, and other outcomes, including the specific measurement variable (e.g., systolic blood pressure), analysis metric (e.g., change from baseline, final value, time to event), method of aggregation (e.g., median, proportion), and time point for each outcome. Explanation of the clinical relevance of chosen efficacy and harm outcomes is strongly recommended	7,8, Figure 1
6				
7				
8	Participant timeline	13	Time schedule of enrolment, interventions (including any run-ins and washouts), assessments, and visits for participants. A schematic diagram is highly recommended (see Figure)	Figure 1
9				
10	Sample size	14	Estimated number of participants needed to achieve study objectives and how it was determined, including clinical and statistical assumptions supporting any sample size calculations	14-15
11				
12	Recruitment	15	Strategies for achieving adequate participant enrolment to reach target sample size	14-15
13	Methods: Assignment of interventions (for controlled trials)			
14	Allocation:			
15	Sequence generation	16a	Method of generating the allocation sequence (e.g., computer-generated random numbers), and list of any factors for stratification. To reduce predictability of a random sequence, details of any planned restriction (e.g., blocking) should be provided in a separate document that is unavailable to those who enrol participants or assign interventions	13
16				
17	Allocation concealment mechanism	16b	Mechanism of implementing the allocation sequence (e.g., central telephone; sequentially numbered, opaque, sealed envelopes), describing any steps to conceal the sequence until interventions are assigned	13
18				
19	Implementation	16c	Who will generate the allocation sequence, who will enrol participants, and who will assign participants to interventions	13
20	Blinding (masking)	17a	Who will be blinded after assignment to interventions (e.g., trial participants, care providers, outcome assessors, data analysts), and how	13
21				
22		17b	If blinded, circumstances under which unblinding is permissible, and procedure for revealing a participant's allocated intervention during the trial	13
23	Methods: Data collection, management, and analysis			
24	Data collection methods	18a	Plans for assessment and collection of outcome, baseline, and other trial data, including any related processes to promote data quality (e.g., duplicate measurements, training of assessors) and a description of study instruments (e.g., questionnaires, laboratory tests) along with their reliability and validity, if known. Reference to where data collection forms can be found, if not in the protocol	Figure 1
25				
26		18b	Plans to promote participant retention and complete follow-up, including list of any outcome data to be collected for participants who discontinue or deviate from intervention protocols	14-15
27				
28	Data management	19	Plans for data entry, coding, security, and storage, including any related processes to promote data quality (e.g., double data entry; range checks for data values). Reference to where details of data management procedures can be found, if not in the protocol	14-15
29				
30	Statistical methods	20a	Statistical methods for analysing primary and secondary outcomes. Reference to where other details of the statistical analysis plan can be found, if not in the protocol	15-16
31				
32		20b	Methods for any additional analyses (e.g., subgroup and adjusted analyses)	15-16
33				
34		20c	Definition of analysis population relating to protocol non-adherence (e.g., as randomised analysis), and any statistical methods to handle missing data (e.g., multiple imputation)	15-16
35	Methods: Monitoring			
36	Data monitoring	21a	Composition of data monitoring committee (DMC); summary of its role and reporting structure; statement of whether it is independent from the sponsor and competing interests; and reference to where further details about its charter can be found, if not in the protocol. Alternatively, an explanation of why a DMC is not needed	--
37				
38		21b	Description of any interim analyses and stopping guidelines, including who will have access to these interim results and make the final decision to terminate the trial	--
39

41				
42				
43	2			
44				
45				
46				

1			
2			
3			
4			
5	Harms	22	Plans for collecting, assessing, reporting, and managing solicited and spontaneously reported adverse events and other unintended effects of trial interventions or trial conduct
6	Auditing	23	Frequency and procedures for auditing trial conduct, if any, and whether the process will be independent from investigators and the sponsor
7			
8	Ethics and dissemination		
9	Research ethics approval	24	Plans for seeking research ethics committee/institutional review board (REC/IRB) approval
10	Protocol amendments	25	Plans for communicating important protocol modifications (e.g., changes to eligibility criteria, outcomes, analyses) to relevant parties (e.g., investigators, REC/IRBs, trial participants, trial registries, journals, regulators)
11	Consent or assent	26a	Who will obtain informed consent or assent from potential trial participants or authorised surrogates, and how (see Item 32)
12		26b	Additional consent provisions for collection and use of participant data and biological specimens in ancillary studies, if applicable
13	Confidentiality	27	How personal information about potential and enrolled participants will be collected, shared, and maintained in order to protect confidentiality before, during, and after the trial
14	Declaration of interests	28	Financial and other competing interests for principal investigators for the overall trial and each study site
15			
16	Access to data	29	Statement of who will have access to the final trial dataset, and disclosure of contractual agreements that limit such access for investigators
17	Ancillary and post-trial care	30	Provisions, if any, for ancillary and post-trial care, and for compensation to those who suffer harm from trial participation
18			
19	Dissemination policy	31a	Plans for investigators and sponsor to communicate trial results to participants, healthcare professionals, the public, and other relevant groups (e.g., via publication, reporting in results databases, or other data sharing arrangements), including any publication restrictions
20		31b	Authorship eligibility guidelines and any intended use of professional writers
21		31c	Plans, if any, for granting public access to the full protocol, participant-level dataset, and statistical code
22			
23	Appendices		
24	Informed consent materials	32	Model consent form and other related documentation given to participants and authorised surrogates
25			Annex 2
26	Biological specimens	33	Plans for collection, laboratory evaluation, and storage of biological specimens for genetic or molecular analysis in the current trial and for future use in ancillary studies, if applicable

HOJA DE INFORMACIÓN AL PACIENTE

Título del Estudio	Ensayo clínico aleatorizado, de superioridad, doble ciego, controlado con placebo, en fase II, para demostrar la eficacia del trasplante de microbiota fecal en la descolonización intestinal selectiva de los pacientes colonizados por <i>Klebsiella pneumoniae</i> productora de carbapenemasa tipo KPC
Código del estudio	KAPEDIS
Promotor	Fundación para la Investigación Biomédica de Córdoba
Investigador principal	Juan José Castón Osorio
Centro	Hospital Universitario Reina Sofía de Córdoba

Introducción

Nos dirigimos a usted para informarle sobre un estudio de investigación en el que se le invita a participar. El estudio ha sido aprobado por un Comité de Ética de la Investigación con medicamentos y por la Agencia Española de Medicamentos y Productos Sanitarios, de acuerdo a la legislación vigente, el Real Decreto 1090/2015 de 4 de diciembre y el Reglamento Europeo 536/2014 de 16 de abril, por los que se regulan los ensayos clínicos con medicamentos.

Nuestra intención es que usted reciba la información correcta y suficiente para que pueda decidir si acepta o no participar en este estudio. Para ello lea esta hoja informativa con atención y nosotros le aclararemos las dudas que le puedan surgir.

Además, puede consultar con las personas que considere oportuno.

Participación voluntaria

Le invitamos a participar en el estudio porque usted presenta una colonización por una bacteria multirresistente (*Klebsiella pneumoniae* productora de carbapenemasa KPC). Debe saber que su participación en este estudio es voluntaria y que puede decidir NO participar. Si decide participar, puede cambiar su decisión y retirar el consentimiento en cualquier momento, sin que por ello se altere la relación con su médico ni se produzca perjuicio alguno en su atención sanitaria.

Objetivo del estudio

El objetivo principal del estudio es determinar si el trasplante de microbiota intestinal es eficaz para la descolonización intestinal en pacientes colonizados por *Klebsiella pneumoniae* portadora de KPC.

Descripción del estudio

Este estudio pretende incluir un total de 120 pacientes con colonización intestinal por *Klebsiella pneumoniae* portadora de KPC. Se entiende por colonización intestinal la presencia de esta bacteria en la flora intestinal.

En todos los seres humanos habitan de forma natural millones de microorganismos, sobre todo bacterias, y fundamentalmente en el intestino. Para mantener el estado de salud de un individuo es necesario un complejo equilibrio entre estas bacterias. La edad avanzada, la depresión del sistema inmune y la toma de antibióticos son factores que alteran el ecosistema microbiológico del intestino. Se ha comprobado que la ruptura de este delicado equilibrio favorece la proliferación de bacterias causantes de enfermedad como *Clostridium difficile*.

El trasplante de microbiota intestinal consiste en la introducción de una muestra de bacterias intestinales procedentes de un donante sano en el tracto gastrointestinal de otra persona. Ello podría permitir la sustitución de las bacterias resistentes del intestino del receptor (usted) por las bacterias del intestino del donante. Para realizar el trasplante, en primer lugar se somete al receptor, al donante y a la muestra de material fecal a una serie de pruebas diagnósticas para garantizar la seguridad biológica del proceso de las partes implicadas. Seguidamente las heces se procesan en el laboratorio hasta obtener un líquido claro libre de material de desecho, que se llama sobrenadante. Por último, este sobrenadante se administra en el intestino grueso del enfermo mediante cápsulas que son ingeridas por el receptor. El fundamento para ello es que la flora intestinal normal procedente del donante sustituya a las bacterias resistentes que están presentes en su intestino.

El trasplante de microbiota intestinal está actualmente indicado en la infección por *Clostridium difficile* recurrente. Además de esta indicación, en la actualidad el trasplante de microbiota está siendo estudiado para comprobar si es eficaz para la descolonización de pacientes con colonización intestinal por bacterias resistentes a antibióticos.

Si acepta participar en nuestro estudio usted será asignado de forma aleatoria (al azar) a recibir cápsulas que contienen microbiota intestinal o placebo (una cápsula con el mismo

aspecto que la que contiene microbiota intestinal, pero que no es farmacológicamente activa y por tanto no se espera que tenga efecto). Usted tendrá un 50% de probabilidades de entrar en cada grupo del estudio. Ni el médico ni usted sabrán cuál es el tratamiento que va a recibir.

Actividades del estudio

Su periodo de participación en el estudio será de 90 días. Esta participación se divide en dos fases, por un lado la fase de tratamiento que será el primer día tras su inclusión en el estudio y posteriormente una fase de seguimiento hasta el día 90 después del tratamiento. En la fase de tratamiento usted recibirá 4-5 cápsulas que contendrán trasplante de microbiota o placebo (una sustancia inocua y sin efecto terapéutico). El día previo a la toma de las cápsulas usted recibirá una preparación laxante (un sobre de macrogol disuelto en 125 ml de agua).

En total se realizarán 4 visitas, con la periodicidad establecida en la tabla adjunta. Se realizará una primera visita de selección (día 0), entre 7 y 10 días después la visita 1, la visita de prueba de descolonización que se realizará alrededor (entre 4 días antes o después) de los 30 días después de la visita de selección, y la visita 3 que se efectuará alrededor (entre 5 días antes o después) de los 90 días tras la visita de selección.

Estas visitas no se llevarían a cabo en caso de no participar en el estudio, aunque pueden realizarse en su domicilio sin que tenga que desplazarse al hospital si es posible y usted lo desea.

Durante el estudio se le tomarán muestras de sangre y de frotis rectal las cuales se realizarán de forma extraordinaria por su participación en el estudio.

Riesgos y molestias derivados de su participación en el estudio

El trasplante de microbiota intestinal es un procedimiento autorizado en nuestro país para el tratamiento de la diarrea recurrente por la bacteria *Clostridium difficile*. En la actualidad su uso para la descolonización intestinal por bacterias resistentes no está aprobada aún en nuestro país encontrándose en fase experimental.

En los estudios realizados hasta la fecha el trasplante de microbiota se ha mostrado como una estrategia segura, no obstante, estos no pueden excluirse por completo efectos secundarios a largo plazo.

El donante puede presentar alguna enfermedad o infección no encontrada en el momento de su estudio a la que el receptor puede estar expuesto tras el trasplante de microbiota intestinal. Todos los donantes siguen un proceso de selección exhaustivo previo a la toma de la muestra para prevenirle de ser expuesto a alguna enfermedad o infección. Aunque sería extremadamente raro, no podemos descartar por completo ese riesgo.

Algunos pacientes experimentan un breve cuadro de diarrea tras el procedimiento, que suele ceder en las primeras 24-48 horas. Otros síntomas que pueden presentarse con menor frecuencia el día de la intervención son sensación de décimas de fiebre, hinchazón, flatulencia y dolor o molestias abdominales difusas.

Hoja de información al paciente y consentimiento informado – PACIENTE
Código de protocolo: KAPEDIS
Versión de HIP-CI paciente: 1.0 de 4 de septiembre de 2019

Para conocer más sobre los posibles efectos no deseados de este procedimiento consulte al médico del estudio.

Si usted acepta participar en el estudio se le realizarán pruebas (análisis de sangre y heces) antes de proceder al trasplante y posteriormente según el calendario de visitas expuesto en la tabla 1.

Como riesgo derivado de la extracción de sangre puede producirse un pequeño hematoma, puede haber dolor local, hemorragia y muy excepcionalmente, puede producirse infección en el punto donde se extrae la sangre.

Como participante en el estudio tiene la responsabilidad de cumplir todas las visitas y actividades del estudio. También deberá notificar cualquier evento que le suceda o cambios en la medicación en caso de urgencia, ya que no podrá modificarla por su cuenta ni tomarla junto a “plantas medicinales” sin consultar antes con el médico del estudio.

Posibles beneficios

Si demostramos la hipótesis de este estudio, usted habrá contribuido a mejorar las estrategias de descolonización en otros pacientes que como usted, están colonizados por la bacteria *Klebsiella pneumoniae* portadora de KPC. Nuestra estrategia puede permitir evitar el empleo de antibióticos para la descolonización, evitando la aparición de efectos secundarios y de aparición de bacterias resistentes a los antibióticos administrados. No obstante, es posible que no obtenga ningún beneficio para su salud por participar en este estudio.

Advertencia relativa al embarazo

En nuestro estudio no se incluye la participación de mujeres embarazadas. Las mujeres en edad fértil requerirán la realización de un test de gestación, el cual deberá ser negativo para su inclusión en el estudio.

Si usted es mujer, en caso de quedarse embarazada durante su participación en el estudio debe informar a su médico de inmediato para recibir la asistencia médica adecuada. En la actualidad desconocemos los efectos que puede conllevar el trasplante de microbiota fecal sobre el feto.

Hoja de información al paciente y consentimiento informado – PACIENTE
Código de protocolo: KAPEDIS
Versión de HIP-CI paciente: 1.0 de 4 de septiembre de 2019

1
2
3 En caso de producirse un embarazo, se le solicitará la recogida de datos del mismo y de datos
4 de salud de su bebé durante los 12 meses posteriores al nacimiento. Toda la información
5 relativa a su embarazo será tratada de acuerdo a la normativa de protección de datos vigente.
6
7
8
9

10 **Tratamientos alternativos**

11 Actualmente no hay una estrategia definida de forma general para la descolonización intestinal
12 de los pacientes colonizados por bacterias resistentes. Para intentar esta descolonización se
13 emplean distintos antibióticos de forma oral como gentamicina o colistina cuya dosis y tiempo
14 de administración varían en cada centro. Su médico del estudio le dará más información si lo
15 desea.
16
17
18
19

20 **Seguro**

21 El Promotor del estudio dispone de una póliza de seguros que se ajusta a la legislación vigente
22 (Real Decreto 1090/2015) y que le proporcionará la compensación e indemnización en caso
23 de menoscabo de su salud o de lesiones que pudieran producirse en relación con su
24 participación en el estudio, siempre que no sean consecuencia de la propia enfermedad que
25 se estudia o de la evolución propia de su enfermedad como consecuencia de la ineficacia del
26 tratamiento.
27
28
29
30
31

32 Si desea más información relativa a este apartado, consulte con el investigador principal del
33 estudio de su centro.
34
35
36
37

38 Le informamos que es posible que su participación en este ensayo clínico pueda modificar las
39 condiciones generales y particulares (cobertura) de sus pólizas de seguros (vida, salud,
40 accidente...). Por ello le recomendamos que se ponga en contacto con su aseguradora para
41 determinar si la participación en este estudio afectará a su actual póliza de seguros.
42
43
44
45

46 **Protección de datos personales**

47 El promotor se compromete al cumplimiento de la Ley Orgánica 3/2018, de 5 de diciembre,
48 de protección de datos personales y garantía de los derechos digitales, así como el
49 Reglamento (UE) 2016/679 del Parlamento europeo y del Consejo de 27 de abril de 2016
50 relativo a la protección de las personas físicas en lo que respecta al tratamiento de datos
51 personales y a la libre circulación de estos datos (Reglamento general de protección de datos).
52
53
54
55

56 Los datos recogidos para el estudio estarán identificados mediante un código, de manera que
57 no se incluya información que pueda identificarle y sólo su médico del estudio/colaboradores
58
59
60

1
2
3 podrá relacionar dichos datos con usted y con su historia clínica. Por lo tanto, su identidad no
4 será revelada a persona alguna salvo excepciones en caso de urgencia médica o
5 requerimiento legal. El tratamiento, la comunicación y la cesión de los datos de carácter
6 personal de todos los participantes se ajustarán a lo dispuesto en esta ley.
7
8
9

10
11 El acceso a su información personal identificada quedará restringido al médico del
12 estudio/colaboradores, a autoridades sanitarias (Agencia Española de Medicamentos y
13 Productos Sanitarios, autoridades sanitarias extranjeras), al Comité de Ética de la
14 Investigación y al personal autorizado por el promotor (monitores del estudio, auditores),
15 cuando lo precisen para comprobar los datos personales, los procedimientos del estudio
16 clínico y el cumplimiento de las normas de buena práctica clínica (siempre manteniendo la
17 confidencialidad de la información de acuerdo a la legislación vigente).
18
19
20
21
22

23
24 Los datos se recogerán en un fichero de investigación responsabilidad de la institución y se
25 tratarán en el marco de su participación en este estudio. El promotor adoptará las medidas
26 pertinentes para garantizar la protección de su privacidad y no permitirá que sus datos se
27 crucen con otras bases de datos que pudieran permitir su identificación.
28
29
30

31
32 De acuerdo a lo que establece la legislación de protección de datos, usted puede ejercer los
33 derechos de acceso, modificación, oposición y cancelación de datos. También puede limitar
34 el tratamiento de datos que sean incorrectos, solicitar una copia o que se trasladen a un
35 tercero (portabilidad) los datos que usted ha facilitado para el estudio.
36
37
38

39
40 Para ejercitar sus derechos, dirijase al investigador principal del estudio o al Delegado de
41 Protección de Datos del promotor en dpd@imibic.org. Le recordamos que los datos no se
42 pueden eliminar aunque deje de participar en el ensayo para garantizar la validez de la
43 investigación y cumplir con los deberes legales y los requisitos de autorización de
44 medicamentos. Así mismo tiene derecho a dirigirse a la Agencia de Protección de Datos si no
45 queda satisfecho.
46
47
48

49
50 Si usted decide retirar el consentimiento para participar en este estudio, ningún dato nuevo
51 será añadido a la base de datos, pero sí se utilizarán los que ya se hayan recogido.
52
53
54

55
56 El Investigador y el Promotor están obligados a conservar los datos recogidos para el estudio
57 al menos hasta 25 años tras su finalización. Posteriormente, su información personal sólo se
58 conservará por el centro para el cuidado de su salud y por el promotor para otros fines de
59
60

investigación científica si usted hubiera otorgado su consentimiento y si así lo permite la ley y requisitos éticos aplicables.

Si realizáramos transferencia de sus datos codificados fuera de la UE a las entidades de nuestro grupo, a prestadores de servicios o a investigadores científicos que colaboren con nosotros, los datos del participante quedarán protegidos con salvaguardas tales como contratos u otros mecanismos establecidos por las autoridades de protección de datos. Si quiere saber más al respecto, puede contactar al Delegado de Protección de Datos del promotor en dpd@imibic.org.

Gastos y compensación económica

El promotor del estudio es el responsable de gestionar la financiación del mismo. Para la realización del estudio el promotor del mismo ha firmado un contrato con el médico del estudio y centro donde se va a realizar.

Ni el investigador ni el centro reciben ninguna compensación económica derivada del estudio.

Usted no tendrá que pagar por los medicamentos ni por pruebas específicas del estudio. Su participación en el estudio no le supondrá ningún gasto adicional a la práctica clínica habitual.

Otra información relevante

Una descripción de este ensayo clínico estará disponible en <https://reec.aemps.es>, según exige la legislación española, así como en <https://clinicaltrials.gov>.

Cualquier nueva información referente al producto en investigación utilizado en el estudio y que pueda afectar a su disposición para participar en el estudio, que se descubra durante su participación, le será comunicada por su médico lo antes posible.

Debe saber que puede ser excluido del estudio si el promotor o los investigadores del estudio lo consideran oportuno, ya sea por motivos de seguridad, por cualquier acontecimiento adverso que se produzca por la medicación en estudio o porque consideren que no está cumpliendo con los procedimientos establecidos. En cualquiera de los casos, usted recibirá una explicación adecuada del motivo que ha ocasionado su retirada del estudio.

Hoja de información al paciente y consentimiento informado – PACIENTE
Código de protocolo: KAPEDIS
Versión de HIP-CI paciente: 1.0 de 4 de septiembre de 2019

Al firmar la hoja de consentimiento adjunta, se compromete a cumplir con los procedimientos del estudio que se le han expuesto.

Si como participante en el estudio dejara de acudir a las visitas sin retirar el consentimiento, el promotor podrá realizar un seguimiento de usted.

Debe usted saber que es posible que su médico de Atención Primaria tenga conocimiento de su participación en este estudio.

¿Qué tratamiento recibiré cuando finalice el ensayo clínico?

Cuando acabe su participación recibirá el mejor tratamiento disponible y que su médico considere el más adecuado para su enfermedad, pero es posible que no se le pueda seguir administrando el producto en investigación del estudio. Por lo tanto, ni el investigador ni el promotor adquieren compromiso alguno de mantener dicho tratamiento fuera de este estudio.

Contacto en caso de dudas

Si durante su participación tiene alguna duda o necesita obtener más información, póngase en contacto con el Dr. _____
del servicio de _____ en el teléfono _____.

CONSENTIMIENTO INFORMADO DEL PARTICIPANTE

Título del estudio: Ensayo clínico aleatorizado, de superioridad, doble ciego, controlado con placebo, en fase II, para demostrar la eficacia del trasplante de microbiota fecal en la descolonización intestinal selectiva de los pacientes colonizados por *Klebsiella pneumoniae* productora de carbapenemasa tipo KPC

Código de protocolo: KAPEDIS. **Versión del protocolo:** 1.0 de 4-septiembre-2019

Yo (nombre y apellidos del participante): _____

- He leído la hoja de información que se me ha entregado sobre el estudio.
- He podido hacer preguntas sobre el estudio.
- He recibido suficiente información sobre el estudio.
- He hablado con (nombre del investigador): _____
- Comprendo que mi participación es voluntaria.
- Comprendo que puedo retirarme del estudio:
 - Cuando quiera.
 - Sin tener que dar explicaciones.
 - Sin que esto repercuta en mis cuidados médicos.

Deseo que me comuniquen la información derivada de la investigación que pueda ser relevante para mi salud: SÍ NO

Recibiré una copia firmada y fechada de este documento de consentimiento informado.
 Presto libremente mi conformidad para participar en el estudio.

2
3 48 **ABSTRACT**

4
5 49 **Introduction:** Infections caused by carbapenemase-producing *Enterobacterales* are frequent
6
7 50 and associated with high rates of mortality. Intestinal carriers are at increased risk of infection
8
9 51 by these microorganisms. Decolonization strategies with antibiotics have not obtained
10
11 52 conclusive results. Fecal microbiota transplantation (FMT) could be an effective and safe
12
13 53 strategy to decolonize intestinal carriers of KPC-producing *Klebsiella pneumoniae* (KPC-Kp) but
14
15 54 this hypothesis needs evaluation in appropriate clinical trials.
16
17
18
19
20

21 56 **Methods and analysis:** The KAPEDIS trial is a single-center, randomized, double-blind, placebo-
22
23 57 controlled, phase 2, superiority clinical trial of FMT for eradication of intestinal colonization by
24
25 58 KPC-Kp. One hundred and twenty patients with rectal colonization by KPC-Kp will be randomized
26
27 59 1:1 to receive encapsulated lyophilized FMT or placebo. The primary outcome is KPC-Kp
28
29 60 eradication at 30 days. Secondary outcomes are: (i) frequency of adverse events; (ii) changes in
30
31 61 KPC-Kp relative load within the intestinal microbiota at 7, 30 and 90 days, estimated by real-
32
33 62 time quantitative PCR analysis of rectal swab samples; and (iii) rates of persistent eradication,
34
35 63 KPC-Kp infection and crude mortality at 90 days. Participants will be monitored for adverse
36
37 64 effects throughout the intervention.
38
39
40
41
42

43 66 **Ethics and dissemination:** Ethical approval was obtained from Reina Sofia University Hospital
44
45 67 Institutional Review Board (approval reference number: 2019-003808-13). Trial results will be
46
47 68 published in peer-reviewed journals and disseminated at national and international
48
49 69 conferences.
50
51

52 70
53
54 71 **Trial registration number:** Clinicaltrials.gov registration number NCT04760665.

59
60

1
2
3 74 **STRENGTHS AND LIMITATIONS OF THIS STUDY**
4

- 5 75 1. The double-blind, randomized, placebo-controlled design will control for spontaneous KPC-
6
7 76 Kp decolonization.
8
9 77 2. A remote, centralized, automatic randomization system together with double-blinding will
10
11 78 be implemented to reduce sources of potential bias.
12
13 79 3. The trial is designed to evaluate the superiority of FMT against placebo in preventing
14
15 80 multidrug-resistant infections.
16
17 81 4. Concomitant administration of antibiotics during the follow-up period could act as
18
19 82 confounder.
20
21 83 5. The double-blind design is a strength of the study, while the single-center design is a
22
23 84 limitation.

Bmjopen-2021-058124_Main manuscript_clean copy

86 INTRODUCTION

87 Multidrug-resistant bacteria represent an important threat to public health and
88 particularly to vulnerable patient populations such as the elderly, the chronically ill,
89 hospitalized patients, transplant and immunosuppressed recipients [1–3]. *Enterobacterales* are
90 especially important from an antimicrobial resistance perspective, since they are a common
91 cause of community-associated, as well as healthcare-associated infections. Carbapenem-
92 resistant *Enterobacterales* (CRE) have been designated as a critical priority in the World Health
93 Organization (WHO) Global Priority List for antimicrobial-resistant bacteria for the
94 development of new antibiotics.

95 The gastrointestinal tract is a reservoir for antibiotic-resistant pathogens that cause
96 disease by a variety of mechanisms. There is increasing evidence that the commensal
97 microbiota have an indirect role in the control of pathogen invasion by stimulating host
98 immunity in the intestines [4]. Antibiotic treatment drastically alters the composition of the
99 microbiota, interfering with this immunological balance, and promoting selection and
100 proliferation of antibiotic-resistant pathogens [4]. Conversely, the commensal microbiota may
101 be manipulated to prevent or cure infections caused by pathogenic bacteria, such as
102 *Clostridium difficile* or multidrug-resistant organisms (MDRO), including vancomycin-resistant
103 *Enterococcus faecium* and Gram-negative Enterobacterales [4,5]. So far, the most common
104 control strategy for prevention of CRE infection in colonized patients is selective intestinal
105 decolonization (SDD) with oral, non-absorbable antibiotics, including colistin and
106 aminoglycosides [6–10]. The reported decolonization rates in observational studies range
107 between 27.5% and 71% [10,11]. However, development of resistance to decolonizing agents
108 is frequently reported and there is a lack of randomized clinical trials (RCT) that allow adequate
109 assessment of the effectiveness and safety of this strategy [9]. Considering these limitations,
110 the clinical guidelines from the European Society of Clinical Microbiology and Infectious

1
2
3 111 Diseases and European Committee on Infection Control (ESCMID-ECIC) do not recommend
4
5 112 routine SDD of CRE carriers [10].
6

7 113 Fecal microbiota transplantation is an emerging therapy for targeting and modulating
8
9 114 the human intestinal microbiota [12]. It has been demonstrated to be highly effective in patients
10
11 115 with recurrent *Clostridioides difficile* infection (CDI) and has been incorporated into an European
12
13 116 consensus document [13]. Promising results suggest that FMT may also be beneficial for the
14
15 117 management of other disorders associated with gut microbiota dysbiosis. Recently, FMT has
16
17 118 received attention as a potential decolonization strategy for MDRO [14–21]. So far, a single
18
19 119 randomized control trial (RCT) has evaluated whether oral antibiotics followed by FMT could
20
21 120 eradicate intestinal carriage with extended-spectrum beta-lactamase-producing
22
23 121 *Enterobacterales* (ESBL-E, 72% of patients) or carbapenem-resistant *Enterobacterales* (CRE, 28%
24
25 122 of patients) [16]. The study failed to show non-inferiority of FMT, however, there were
26
27 123 important limitations, including the lack of a placebo control, and failure to reach the targeted
28
29 124 number of patients due to legislative impediments [16]. Besides this RCT, a recent meta-analysis
30
31 125 evaluated five European studies (three case series and two case reports), and reported an
32
33 126 overall 46% successful decolonization rate at one month after FMT, with higher decolonization
34
35 127 rates for *P. aeruginosa* (100% decolonization in 4 cases) as compared to New Delhi metallo-
36
37 128 lactamase (NDM-1)-producing *Klebsiella pneumoniae* (36.4%) and ESBL-producing *Klebsiella*
38
39 129 *pneumoniae* (40%) [22]. In contrast, a recent prospective cohort study including 15 CRE carriers
40
41 130 reported 60% eradication rates at one month after FMT [20]. In this study, *Klebsiella*
42
43 131 *pneumoniae* was the most common species (7/15) and *blaKPC* (*Klebsiella*
44
45 132 *pneumoniae* carbapenemase) was the most common carbapenemase gene (9/15), followed by
46
47 133 *blaOXA-48* (oxacillinase-48) (5/15) and *blaNDM* (1/15) [20]. The observed differences in
48
49 134 effectiveness of FMT for eradication of MDRO may be explained by differences in FMT
50
51 135 conditions among studies, including bowel preparation before FMT, the donor, the dose, and
52
53 136 FMT preparation and administration procedures. Importantly, overall, studies report minor
54
55
56
57
58
59
60

Bmjopen-2021-058124_Main manuscript_clean copy

137 adverse events in patients who received FMT for MDRO eradication, and these include vomiting,
138 diarrhea, abdominal pain, and ileus [22,23].

139 Despite all the limitations, the available evidence suggests a potential benefit of FMT as
140 a decolonization intervention for CRE, however this needs to be confirmed by future well-
141 designed RCTs. We have designed a phase II, double-blind, placebo-controlled clinical trial to
142 assess the efficacy of oral FMT capsules to eradicate colonization, with KPC carbapenemase-
143 producing *Klebsiella pneumoniae* (KPC-Kp).

145 **METHODS AND ANALYSIS**

146 **TRIAL DESIGN AND STUDY SETTING**

147 Randomized, double-blind, placebo-controlled, phase 2, superiority clinical trial with two
148 parallel arms: 120 patients will be randomized 1:1 to receive FMT capsules (N=60) or placebo
149 (N=60) (**Figure 1**). Participants will be recruited from Reina Sofia University Hospital, a 1000-bed
150 tertiary, academic, public hospital located in Cordoba, Spain. Some patients may be hospitalized
151 at the time of recruitment and will thus be included during hospital stay. Participants who are
152 not hospitalized or are discharged from hospital will be invited to attend the outpatient clinic.
153 We followed SPIRIT (Standard Protocol Items: Recommendations for Interventional Trials)
154 guidance, outlined in a 33-item checklist (**Annex 1**) and **Figure 1** [24].

156 **Primary objective**

- 157 • To assess the efficacy of oral FMT capsules to eradicate intestinal colonization by KPC-
158 producing *Klebsiella pneumoniae* at 30 days after FMT.

159

1
2
3 160 **Primary outcome**
4

- 5
6 161 • KPC-Kp eradication rate at 30 days in the intention-to-treat population, including all
7
8 162 randomized patients.
9

10 163

11
12
13 164 **Secondary objectives**
14

- 15
16 165 • To evaluate the safety of FMT.
17
18 166 • To determine if FMT is associated with an early (7 days post-FMT) and late (30 days post-
19
20 167 FMT) decrease in the relative load of KPC-Kp within the intestinal microbiota.
21
22 168 • To evaluate if FMT is associated with persistent intestinal eradication at 3 months after
23
24 169 intervention.
25
26 170 • To study if FMT is associated with a decrease in the incidence of KPC-Kp infections at 3
27
28 171 months after intervention.
29
30 172 • To evaluate if FMT is associated with a decrease in mortality due to KPC-Kp infections at 3
31
32 173 months after intervention.
33
34 174

35
36
37
38
39 175 **Secondary outcomes**
40

- 41 176 • Proportion of patients with adverse events during follow-up: (i) reflux following FMT
42
43 177 administration; (ii) intolerable gastrointestinal side effects (i.e., abdominal pain, flatulence,
44
45 178 vomiting, constipation, diarrhoea, or transient fever) leading to discontinuation of FMT
46
47 179 before completing the study; (iii) occurrence of any adverse/serious adverse effects.
48
49 180 • Changes in the relative load of KPC-Kp within the intestinal microbiota from day 0 (baseline)
50
51 181 to days 7 (visit 1), 30 (visit 2) and 90 (visit 3), estimated by quantitative real-time PCR analysis
52
53 182 (qPCR) of rectal swab samples (described below).
54
55 183 • Proportion of patients with persistent KPC-Kp eradication at 3 months of follow-up.
56
57 184 • Rate of KPC-Kp infections at 3 months.
58
59
60

Bmjopen-2021-058124_Main manuscript_clean copy

- 1
2
3 185 • Crude mortality rate at 3 months.
4
5 186
6
7
8 187 **Definitions**
9
10
11 188 • Eradication: Negative rectal swab culture for KPC-Kp together with negative polymerase
12
13 189 chain reaction (PCR) test for *bla_{KPC}* gene. If the PCR result is positive, the subject is
14
15 190 considered not-decolonized.
16
17 191 • Early decrease in intestinal KPC-Kp load: Significant reduction in the relative load of KPC-Kp
18
19 192 within the gut microbiota in rectal swab samples obtained at day 7 of follow-up (visit 2) in
20
21 193 patients receiving FMT versus placebo.
22
23 194 • Late decrease in intestinal KPC-Kp load: Significant reduction in the relative load of KPC-Kp
24
25 195 within the gut microbiota in rectal swab samples obtained at day 30 of follow-up (visit 3)
26
27 196 in patients receiving FMT versus placebo.
28
29 197 • Early decolonization: Negative rectal swab culture for KPC-Kp and negative polymerase
30
31 198 chain reaction (PCR) test for *bla_{KPC}* gene within 7-10 days of intervention.
32
33 199 • Persistent decolonization: Negative rectal swab culture for KPC-Kp and
34
35 200 negative polymerase chain reaction (PCR) test for *bla_{KPC}* gene on days 30 and 90 after the
36
37 201 intervention.
38
39 202 • KPC-Kp infection: i) Proven infection: KPC-Kp isolated from clinical specimens in the
40
41 203 presence of clinical signs and symptoms of infection; ii) Probable infection: presence of
42
43 204 clinical signs and symptoms of infection requiring treatment against KPC-Kp at the
44
45 205 discretion of the attending physician, without isolation of KPC-Kp from clinical specimens.
46
47 206 • Crude mortality: All-cause mortality during follow-up.
48
49 207 • Intention-To-Treat (ITT) population: all randomized patients.
50
51
52
53
54
55
56
57
58
59
60

- 1
2
3 208 • Per protocol population (PPP): Patients who meet the following criteria: (i) having been
4
5 209 randomized; (ii) complete data for the primary objective; (iii) not having received
6
7 210 antibiotics between randomization and visit 3.
8
9
10 211 • Microbiologically evaluable population (PME): patients in whom all rectal colonization
11
12 212 studies have been performed during follow-up.
13
14
15 213

214 **Patient eligibility criteria**

215 Inclusion criteria:

- 216 • Adult current or previous patients at Reina Sofía University Hospital with a positive rectal
217 swab for KPC-Kp within one week before randomization.
218 • The participant or legal representative must be able to provide written informed consent.
219 • Absence of KPC-Kp clinical samples at the time of informed consent and in the previous
220 month.
221

222 Exclusion criteria:

- 223 • Terminal illness or life expectancy of 3 months or less.
224 • Pregnancy or breastfeeding.
225 • Inability/unwillingness to orally ingest study medication.
226 • Dysphagia and aspiration disorders.
227 • A history of colectomy, colostomy, or ileostomy.
228 • Patients who have been treated with antibiotics within 30 days prior to consent.
229 • Absolute neutrophil count < 500/mm³.
230 • Planned myelosuppressive chemotherapy within 30 days of randomization, i.e.
231 dexamethasone, chemotherapy against solid tumors or prior to hematopoietic stem cell
232 transplant (HSCT).

Bmjopen-2021-058124_Main manuscript_clean copy

- 233 • HSCT within 30 days prior to consent.
- 234 • Clinical symptoms and signs of mucositis.
- 235 • Major abdominal surgery within the upcoming 30 days.
- 236 • Patients with Giannella Risk Score > 12 puntos [25].
- 237 • Selective Digestive Decolonization with oral antibiotics within 3 months prior to
- 238 randomization.
- 239 • Severe food allergy.

240

241 Donor selection

242 General considerations

243 Donor selection and screening criteria for FMT is not currently standardized, showing variability
244 among studies. In this RCT, we will use the exclusion criteria and conduct the microbiological
245 studies suggested by García-García de Paredes *et al.* [26] and Huttner *et al.* [16]. To ensure
246 double-blinding, only donors not related to the patients will be selected. This strategy has been
247 shown to be safe and effective in studies where FMT was used as a treatment for *C. difficile*
248 infection [27,28]. Initially, an interview and a questionnaire specifically designed for this purpose
249 (**Supplementary Tables S1 and S2**) will be carried out with the potential donor to identify the
250 risk of diseases, especially those that may go unnoticed due to the unavailability of specific or
251 sensitive diagnostic tests. Subsequently, a microbiological screening of the donor's blood and
252 faeces as well as nasopharyngeal screening for Sars-CoV-2 will be performed on valid donors
253 (**Supplementary Table S3**). Based on expert recommendations, the pre-donation study will be
254 carried out no longer than 4 weeks before donation [13]. This donor screening will be valid for
255 two months after the first donation. After this period, microbiological screening will be
256 repeated. If the same donor is required for a new donation period, the screening by
257 questionnaire and all microbiological tests will be repeated.

1
2
3 258 Donor inclusion criteria
4

- 5 259 • To be aged between 18 and 60 years.
6
7 260 • To be in good health without significant past medical history.
8
9 261 • To have a normal body weight (body mass index between 20 and 25 kg/m²).
10
11 262 • To have a stool with a normal appearance.
12
13 263 • To have an average stool frequency (1-3/day).
14
15 264 • Not to have an acute or chronic digestive disorder.
16
17
18
19

20 265 Donor exclusion criteria
21

- 22 266 • Infectious disease tests: HIV infection, hepatitis B and C, risk of transmission of HIV in the
23 267 last 12 months, hepatitis B and C, risky sexual behaviours, use of illicit drugs, tattoos or
24 268 piercings in the previous six months, current or prior history of stay in prison, current
25 269 communicable disease, risk factors for Creutzfeldt-Jakob disease, travel in the last six
26 270 months to countries with endemic diarrheal diseases or high risk of traveller's diarrhoea,
27 271 history of *C. difficile* diarrhoea.
28
29 272 • Gastrointestinal comorbidities: inflammatory bowel disease, irritable bowel syndrome,
30 273 chronic constipation or chronic diarrhoea, history of gastrointestinal malignancy or
31 274 polyposis.
32
33 275 • Factors that can alter the intestinal microbiota: use of antibiotics in the last three months,
34 276 use of immunosuppressants, glucocorticoids, calcineurin inhibitors, biological agents, use of
35 277 antineoplastic drugs.
36
37 278 • Specific to the receptor: recent ingestion of an allergen to which the receptor is allergic.
38
39 279 Others: previous major surgery of the digestive system, metabolic syndrome, diabetes
40 280 mellitus, autoimmune diseases, connective tissue diseases, atopic diseases (asthma,
41 281 eczema, eosinophilic pathologies of the gastrointestinal tract), chronic pain syndromes
42 282 (fibromyalgia, chronic fatigue syndrome).

283

284 **Microbiological studies**

285 Rectal swab samples will be analysed for the presence of CRE, using both culture on
286 selective chromogenic agar plates (CHROMID® CARBA, bioMérieux, Marcy-l'Étoile, France), and
287 quantitative real-time PCR.

288 For bacteria grown on culture, identification will be performed using MALDI- TOF mass
289 spectrometry (Bruker, Germany) and carbapenemase production will be evaluated by a multiple
290 strategy: (1) Antimicrobial susceptibility testing, with a first step using the commercial system
291 MicroScan WalkAway and NC53 broth microdilution panels (Beckman Coulter, USA), and a
292 second step, when a KPC-producing *K. pneumoniae* is identified, determining the Minimal
293 Inhibitory Concentrations (MICs) of ertapenem, imipenem, meropenem and other relevant
294 agents (including ceftolozane-tazobactam, ceftazidime-avibactam, imipenem-relebactam and
295 meropenem-vaborbactam cefiderocol, fosfomycin, colistin, eravacycline) using EUMDROXF
296 microdilution panels (Sensititre™, Thermofisher, USA); clinical categories will be defined
297 according to EUCAST breakpoints; (2) the Modified Carbapenem Inactivation Method, using
298 meropenem discs [29]; (3) an immunochromatography test for the independent identification
299 of OXA-48-like, KPC, NDM, imipenemase (IMP) and Verona integron-encoded metallo-beta-
300 lactamase (VIM) families of carbapenemases (NG-Test CARBA 5; NG Biotech, Guipry, France) and
301 (4) conventional PCR for detection of the complete *blaKPC* gene, complemented with
302 sequencing of the two DNA strands of corresponding amplicon when a positive result is
303 obtained.

304 Quantification of the intestinal load of *blaKPC* gene in rectal swabs will be performed by
305 quantitative real-time PCR. The load will be calculated relative to the total bacterial population
306 (represented by the 16S rRNA gene) using the $\Delta\Delta C_t$ method and pure cultures of KPC-producing
307 *K. pneumoniae* as reference standards, as described in [30,31].

308

309 **Interventions**310 Trial interventions

311 Patients will be randomised 1:1 to receive oral capsules containing FMT or placebo.
312 Mikrobiomik Healthcare Company S.L. (Vizcaya, Spain) will supply the FMT product (MBK-01),
313 which consists of lyophilised microbiota encapsulated in hypromellose capsules (size 0), with a
314 median mass of 250 g per capsule. Treatment will consist of 4 capsules, containing 1 g of
315 lyophilized microbiota with $\geq 2 \times 10^{11}$ total bacterial cells, obtained from a unique batch of
316 lyophilised microbiota. Each batch of microbiota will be obtained from a minimum of 50 g
317 donor feces, based on previous studies supporting the efficacy of this dosing for treatment of
318 *Clostridioides difficile* infection [32]. Participants in the placebo arm will receive 4 capsules
319 containing microcrystalline cellulose with the same shape, size and weight. The company will
320 also supply the empty capsules to which the placebo will be added at the Pharmacy Service in
321 our hospital. Capsules will be stored, with desiccant, at a temperature of $5 \pm 3^\circ\text{C}$, until they are
322 dispensed. Mikrobiomik Healthcare Company will guarantee the traceability of the capsules
323 and a record will be made of their storage, dispensing and destruction. Treatment will be
324 dispensed to trial participants in presence of a member of the research team in a single dose
325 in one day.

326

327 Concomitant care and interventions

328 Patients will fast for 12 hours and will receive a laxative preparation (one macrogol 3350,
329 Movicol 13.8 g[®] sachet dissolved in 125 ml water) the day before study intervention. The
330 concomitant use of systemic antibiotics with activity against KPC-Kp at the time of intervention
331 will not be allowed. Administration of these antibiotics during the study will be considered a
332 proven or probable infection. During the follow-up period, administration of other
333 decolonization guidelines will not be allowed either. Other non-excluded drugs will be allowed.

Bmjopen-2021-058124_Main manuscript_clean copy

334

335 **Assignment of interventions**

336 Allocation to treatment arms will be performed using a centralized, web-based
337 automated randomization system, integrated with the electronic case report file (eCRF), and
338 will be hosted by Maimonides Institute for Biomedical Research of Cordoba (Cordoba, Spain).
339 After the patient's enrolment is confirmed, the randomization specialist will assign a computer-
340 generated random number to each patient. The randomization data will be sent to a designated
341 mailbox, and the responsible nurse will collect the treatment from the pharmacy at the hospital
342 according to the assigned results. A double-blinded design will be used in this study for the
343 physicians and statistical specialists, and patients and research assistants. However, the
344 pharmacist will know the group of each patient. The allocation of the participants' treatment
345 may be revealed at the end of the data analysis.

346

347 **Evaluation during and after treatment**

348 All patients will be followed for 90 days (± 5 days) after the intervention or until death.
349 Four follow-up visits will be scheduled for all participants at day 0 (baseline), day 7–10 (visit 1);
350 day 30 \pm 4 (visit 2), and day 90 \pm 5 (visit 3) after end of intervention. The procedures that will be
351 performed at each visit are indicated in **Figure 1**. A rectal swab sample will be obtained at each
352 visit for colonization studies and quantification of KPC-Kp load by qPCR (see below). If a
353 participant fails to be present at a scheduled visit, all attempts to contact them and any
354 retrieved information will be recorded. A minimum of three documented contact attempts via
355 phone calls will be performed, on separate occasions. All data collected will be included in an
356 electronic database specifically designed for this study, with password-protected user
357 authentication. To ensure the quality of the data, independent audits from investigators and
358 sponsors may be carried out at any moment of the study.

1
2
3 359
4
56 360 **Adverse effects**
7

8 361 Adverse effects will be recorded and reported as part of routine follow-up. All events
9
10 362 fulfilling the criteria of a serious adverse event that occur during the period of study will be
11
12 363 reported to the promoter within 24 hours post event occurrence. An insurance policy will be
13
14 364 contracted to cover any harm from trial participation.
15
16

17
18 365
1920 366 **Sample size calculation**
21

22
23 367 Sample size calculation was performed with G*Power 3.1 program
24
25 368 (<https://gpower.software.informer.com/3.1/>), assuming the following estimates: 90% power;
26
27 369 5% alpha error; decolonization rate at 30 days of 30% in the control group based on a recent
28
29 370 metanalysis reporting CRE colonization rates of 76.7% (95% confidence interval 64%-81.8%) at
30
31 371 1 month in the absence of intervention [11]; decolonization rate of 60% in the experimental
32
33 372 group, based on a recently published study [18]; 1:1 treatment to placebo ratio; superiority
34
35 373 considered if the confidence interval lower bound for the difference between decolonization
36
37 374 rates in the experimental and control groups is greater than 5%; and expected informed
38
39 375 consent rate of 40%. With these considerations, the sample size results in 112 patients. We
40
41 376 added 7% more patients in order to account for possible loss to follow-up, resulting in a final
42
43 377 sample size of 120 patients (60 patients in the experimental group and 60 patients in the
44
45 378 control group). To reach the sample size, we will perform active surveillance of patients with
46
47 379 KPC-Kp isolated from microbiological samples in our hospital.

Bmjopen-2021-058124_Main manuscript_clean copy

381 **Withdrawal from study**

382 In accordance with the Declaration of Helsinki, patients have the right to withdraw from
383 the study at any time and for any reason, communicating this decision personally or through
384 their representative. The study withdrawal criteria will be the following: a) at the request of the
385 patient, through withdrawal of informed consent; b) when the patient no longer complies with
386 protocol indications (protocol deviation); c) as a result of any adverse event, regardless of its
387 intensity, at the discretion of the investigator; d) when for any reason the treatment is no longer
388 safe for the patient; e) as a result of an administrative decision taken by the researchers,
389 sponsor, or regulatory authority; f) as a result of loss of contact during follow-up. If a patient is
390 withdrawn from the trial prematurely, the investigator will register the main reason for the
391 withdrawal in the Clinical Research File. Whenever necessary, the patient will continue to be
392 followed, according to the standard protocols for treatment of their pathology, at the discretion
393 of the responsible physician.

395 **Statistical analysis**

396 Frequencies and percentages of categorical variables, and median and interquartile
397 ranges of continuous variables will be described. Comparisons will be performed using Chi-
398 square or Fisher's test for categorial variables, and Student's T or Mann-Whitney U test for
399 normally and not-normally distributed continuous variables, respectively.

400 The absolute difference in the percentages of decolonization between the patients in
401 the experimental and control groups, and its 95% confidence interval, will be calculated.
402 Clinically significant superiority will be considered if the 95% confidence interval lower bound is
403 greater than 5%. For the primary and secondary endpoints, the main analyses will be carried out
404 in the intention-to-treat (ITT) population. Then, an analysis will also be carried out in the per-

1
2
3 405 protocol (PP) population (see definitions). All analyses will be performed using IBM SPSS
4
5 406 Statistics software.

10 408 **ETHICS AND DISSEMINATION**

11
12
13 409 The study is funded by Instituto de Salud Carlos III (Science and Innovation Ministry,
14
15 410 Spanish government). It was authorized and approved by the ethical review board. Consent to
16
17 411 participate will be obtained from all participants prior to the start of the trial by physicians
18
19 412 included in our research team. The informed consent is provided as **Annex 2**. All data will be
20
21 413 anonymized. The study is being conducted in compliance with the protocol, regulatory
22
23 414 requirements, International Council of Harmonization (ICH) E6 Good Clinical Practice and the
24
25 415 ethical principles of the latest version of the Declaration of Helsinki, as adopted by the World
26
27 416 Medical Association. Each substantial protocol amendment will be notified for approval to the
28
29 417 relevant ethics committee(s) prior to implementation. The trial is registered with
30
31 418 ClinicalTrials.gov as NCT04760665 (February 18, 2021). All data collected will be kept strictly
32
33 419 confidential and in accordance with all relevant legislation on control and protection of personal
34
35 420 information. The participants will be identified on documentation by a unique ID number, not
36
37 421 by name, in agreement with the European Regulation on data protection (EU 2016/679). All
38
39 422 study-related information will be stored securely. The final results will be publicly disseminated
40
41 423 regardless of the study outcomes. The results of this study will be published in peer-reviewed
42
43 424 journals, as well as national and international conferences.

DISCUSSION

In recent years there has been a significant increase in the frequency of infections caused by carbapenem-producing *Enterobacterales* (CRE). These infections are associated with high mortality rates as a result of the difficulty in initiating effective empirical treatment and the limited therapeutic alternatives available for targeted treatment [33,34]. Rectal colonization with CRE has previously been identified as an important risk factor for the development of subsequent CRE infection [9,25,35,36]. This situation has promoted efforts to prevent the acquisition and spread of these bacteria, including development of novel decolonization strategies.

The utility of fecal microbiota transplantation (FMT) for gut decolonization of multidrug resistant organisms has been explored in several case reports, one prospective observational cohort and one RCT, summarized in a number of systematic reviews and metanalysis [20,22,23,37,38]. The only RCT, conducted by the R-GNOSIS study group, tested the efficacy of frozen capsulized FMT following a 5-day course of oral antibiotics in 39 carriers of CRE [16]. The desirability of pre-FMT antibiotic therapy in the context of MDRO decolonization is unclear. Firstly, the administration of antibiotics renders it very difficult to unravel the independent contributions of antibiotics and FMT to CRE decolonization. Secondly, pre-clinical studies with mouse models suggest that antibiotic pre-conditioning may improve the engraftment of specific taxa but not the overall engraftment of donor microbiota in the recipient mice [39,40]. Bar-Yoseph *et al* [20] reported that the use of antibiotics in the post-FMT period interfered with FMT engraftment among CRE-colonized recipients [20].

Methods for FMT delivery include colonoscopy, nasoduodenal tub, colonic transendoscopic enteral tubing or oral capsules [13,41,42]. In this RCT, patients will be receiving FMT based on lyophilized oral capsules, which have been proven non-inferior to colonoscopy for the treatment of recurrent CDI and which also have higher acceptance by patients [43]. Further, patients with CRE colonization who receive oral capsulized FMT achieved high

1
2
3 456 eradication success (60%) at one month [20]. In addition, using lyophilized preparations
4
5 457 facilitates capsule handling and stability, making it more feasible in hospital routine.
6

7 458 Regarding the amount of starting stool material, the European Consensus Conference
8
9 459 on Faecal Microbiota Transplantation in Clinical Practice for the treatment of *Clostridium*
10
11 460 *difficile* infection (CDI) recommends a minimum of 30 g for the treatment of recurrent *CDI* [13].
12
13 461 Nevertheless, the optimal dose in FMT remains unclear since no randomized trials have
14
15 462 compared different amounts of faecal matter so far. In the present RCT, the capsules with the
16
17 463 lyophilized FMT material will be provided by an external company, which has been legally
18
19 464 authorized for production of the FMT capsules by the Spanish Agency for Medications and
20
21 465 Healthcare Products (AEMPS). The company will guarantee that each treatment, consisting of a
22
23 466 batch of 4 capsules, will contain a minimum of 2×10^{11} total bacterial cells obtained from a
24
25 467 minimum of 30 g of feces.
26
27
28
29

30 468 The overall aim of this RCT is to evaluate the efficacy and safety of FMT for sustained
31
32 469 eradication of CRE without using antibiotics that could impact the viability of the FMT content
33
34 470 or confound results. It has been designed with placebo control to allow estimation of the
35
36 471 contribution of spontaneous decolonization to CRE eradication. If the efficacy and safety of FMT
37
38 472 are proven, FMT may be considered a better approach for decolonization of gut MDRO than
39
40 473 selective antibiotics decolonization, with lower ecological impact, and potentially reducing the
41
42 474 risk of subsequent infections. A limitation of our study is that immunocompromised patients
43
44 475 have been excluded. While there is increasing evidence of the beneficial effect of FMT for this
45
46 476 patient population [44], given the single-center nature of this RCT, they would be insufficiently
47
48 477 represented to obtain statistically significant results that could justify their inclusion.

637 **TRIAL STATUS**

638 Current protocol approved is version 1.0 dated 4th September 2019. Recruitment will
639 begin on 5th October 2021 and will end on 5th October 2023.

641 **FUNDING**

642. This work was supported by (1) research funds “FIS PI19-00281-KAPEDIS” granted to JJC from
643 *Plan Estatal de I+D+i 2013-2016*, co-financed by the *ISCIII-Subdirección General de Evaluación y*
644 *Fomento de la Investigación and the Fondo Europeo de Desarrollo Regional (FEDER)*; (2) *Plan*
645 *Nacional de I+D+i 2013-2016 and Instituto de Salud Carlos III (ISCIII), Subdirección General de*
646 *Redes y Centros de Investigación Cooperativa, Ministerio de Ciencia, Innovación y Universidades,*
647 Spanish Network for Research in Infectious Diseases (RD16/0016/0008) - co-financed by
648 European Development Regional Fund “*A way to achieve Europe*”, Operative program Intelligent
649 Growth 2014-2020; and (3) The Network Center for Biomedical Research in Infectious Diseases
650 (CIBERINFEC, CB21/13/00049), Instituto de Salud Carlos III (ISCIII), Madrid, Spain. EPN holds a
651 research contract from *Consejería de Salud y Familias, Junta de Andalucía (RH-0065-2020I)*. The
652 funders had no role in study design, data collection and interpretation, or the decision to submit
653 the work for publication.

655 **COMPETING INTEREST STATEMENT**

656 Juan José Castón reports personal fees from Merck for educational purposes and a
657 research grant from Pfizer outside the submitted work. All other authors declare that they have
658 no competing interests.

Figure 1. Schedule of enrolment, interventions, and assessments according to SPIRIT guidelines.

	STUDY PERIOD						
	Enrolment	Allocation	Post-allocation				Closeout
	0 d	0 d	Visit 0 (0 d)	Visit 1 (7-10 d)	Visit 2 (30 ± 4 d)	Visit 3 (90 ± 5 d)	90 d
ENROLMENT:							
Eligibility screen	X						
Informed consent	X						
Pregnancy test ¹	X						
Randomization	X						
Medical history / Anamnesis	X			X	X	X	
Physical examination ²	X			X ³	X ³	X ³	
Hemogram / Biochemistry ³	X			X	X	X	
Serology ⁴	X						
Rectal swab sample	X		X	X	X	X	
Recording of concomitant medication	X			X	X	X	
Dispensing control	X						
Allocation		X					
INTERVENTIONS:							
FMT			X				
Placebo			X				
ASSESSMENTS:							
Primary outcome							
KPC-Kp eradication					X		X
Secondary outcomes							
Adverse events			X	X	X	X	X
Changes in RL _{KPC}			X	X	X	X	X
Decolonization test			X	X	X	X	X
Persistent KPC-Kp eradication						X	X
Rate of KPC-Kp infections						X	X
Crude mortality						X	X

Abbreviations: d, days; FMT, Fecal Microbiota Transplantation; RL_{KPC}, relative intestinal load of *bla*_{KPC}.

¹ If female and of child-bearing age.

² Physical examination: weight, height, blood pressure, heart and respiratory rate and temperature. Does not apply if interview is conducted telephonically.

³ Hemogram with at least hemoglobin, white blood cell count, neutrophils and platelets. Blood chemistry at least with creatinine, urea, bilirubin, transaminases and PCR.

⁴ Serology for hepatitis A, B and C viruses; human immunodeficiency virus (HIV), HIV-1 and HIV-2; nontreponemal rapid plasma reagin (RPR) test, and fluorescent treponemal antibody absorbed (FTA-ABS) test.

Annex 1. SPIRIT 2013 Checklist: Recommended items to address in a clinical trial protocol and related documents.

Section/item	Item No	Description	Page in the document
Administrative information			
Title	1	Descriptive title identifying the study design, population, interventions, and, if applicable, trial acronym	1
Trial registration	2a	Trial identifier and registry name. If not yet registered, name of intended registry	3
	2b	All items from the World Health Organization Trial Registration Data Set	--
Protocol version	3	Date and version identifier	274
Funding	4	Sources and types of financial, material, and other support	274
Roles and responsibilities	5a	Names, affiliations, and roles of protocol contributors	1, 274
	5b	Name and contact information for the trial sponsor	--
	5c	Role of study sponsor and funders, if any, in study design; collection, management, analysis, and interpretation of data; writing of the report; and the decision to submit the report for publication, including whether they will have ultimate authority over any of these activities	274
	5d	Composition, roles, and responsibilities of the coordinating centre, steering committee, endpoint adjudication committee, data management team, and other individuals or groups overseeing the trial, if applicable (see Item 21a for data monitoring committee)	--
Introduction			
Background and rationale	6a	Description of research question and justification for undertaking the trial, including summary of relevant studies (published and unpublished) examining benefits and harms for each intervention	5-7
	6b	Explanation for choice of comparators	5-7
Objectives	7	Specific objectives or hypotheses	7,8
Trial design	8	Description of trial design including type of trial (e.g., parallel group, crossover, factorial, single group), allocation ratio, and framework (e.g., superiority, equivalence, noninferiority, exploratory)	7
Methods: Participants, interventions, and outcomes			
Study setting	9	Description of study settings (e.g., community clinic, academic hospital) and list of countries where data will be collected. Reference to where list of study sites can be obtained	7
Eligibility criteria	10	Inclusion and exclusion criteria for participants. If applicable, eligibility criteria for study centres and individuals who will perform the interventions (e.g., surgeons, psychotherapists)	10-11
Interventions	11a	Interventions for each group with sufficient detail to allow replication, including how and when they will be administered	42-43, 14-15
	11b	Criteria for discontinuing or modifying allocated interventions for a given trial participant (e.g., drug dose change in response to harms, participant request, or improving/worsening disease)	44-45, 16-17
	11c	Strategies to improve adherence to intervention protocols, and any procedures for monitoring adherence (e.g., drug tablet return, laboratory tests)	42, Figure 1
	11d	Relevant concomitant care and interventions that are permitted or prohibited during the trial	40-43, 13-16

1				
2				
3				
4				
5	Outcomes	12	Primary, secondary, and other outcomes, including the specific measurement variable (e.g., systolic blood pressure), analysis metric (e.g., change from baseline, final value, time to event), method of aggregation (e.g., median, proportion), and time point for each outcome. Explanation of the clinical relevance of chosen efficacy and harm outcomes is strongly recommended	7,8, Figure 1
6				
7				
8	Participant timeline	13	Time schedule of enrolment, interventions (including any run-ins and washouts), assessments, and visits for participants. A schematic diagram is highly recommended (see Figure)	Figure 1
9				
10	Sample size	14	Estimated number of participants needed to achieve study objectives and how it was determined, including clinical and statistical assumptions supporting any sample size calculations	44-4516
11				
12	Recruitment	15	Strategies for achieving adequate participant enrolment to reach target sample size	44-4516
13	Methods: Assignment of interventions (for controlled trials)			
14	Allocation:			
15	Sequence generation	16a	Method of generating the allocation sequence (e.g., computer-generated random numbers), and list of any factors for stratification. To reduce predictability of a random sequence, details of any planned restriction (e.g., blocking) should be provided in a separate document that is unavailable to those who enrol participants or assign interventions	153
16				
17	Allocation concealment mechanism	16b	Mechanism of implementing the allocation sequence (e.g., central telephone; sequentially numbered, opaque, sealed envelopes), describing any steps to conceal the sequence until interventions are assigned	153
18	Implementation	16c	Who will generate the allocation sequence, who will enrol participants, and who will assign participants to interventions	153
19				
20	Blinding (masking)	17a	Who will be blinded after assignment to interventions (e.g., trial participants, care providers, outcome assessors, data analysts), and how	153
21		17b	If blinded, circumstances under which unblinding is permissible, and procedure for revealing a participant's allocated intervention during the trial	153
22				
23	Methods: Data collection, management, and analysis			
24	Data collection methods	18a	Plans for assessment and collection of outcome, baseline, and other trial data, including any related processes to promote data quality (e.g., duplicate measurements, training of assessors) and a description of study instruments (e.g., questionnaires, laboratory tests) along with their reliability and validity, if known. Reference to where data collection forms can be found, if not in the protocol	Figure 1
25		18b	Plans to promote participant retention and complete follow-up, including list of any outcome data to be collected for participants who discontinue or deviate from intervention protocols	44-4516-17
26				
27	Data management	19	Plans for data entry, coding, security, and storage, including any related processes to promote data quality (e.g., double data entry; range checks for data values). Reference to where details of data management procedures can be found, if not in the protocol	44-4516-17
28				
29	Statistical methods	20a	Statistical methods for analysing primary and secondary outcomes. Reference to where other details of the statistical analysis plan can be found, if not in the protocol	45-4617-18
30		20b	Methods for any additional analyses (e.g., subgroup and adjusted analyses)	45-4617-18
31		20c	Definition of analysis population relating to protocol non-adherence (e.g., as randomised analysis), and any statistical methods to handle missing data (e.g., multiple imputation)	45-4617-18
32				
33	Methods: Monitoring			
34	Data monitoring	21a	Composition of data monitoring committee (DMC); summary of its role and reporting structure; statement of whether it is independent from the sponsor and competing interests; and reference to where further details about its charter can be found, if not in the protocol. Alternatively, an explanation of why a DMC is not needed	--
35		21b	Description of any interim analyses and stopping guidelines, including who will have access to these interim results and make the final decision to terminate the trial	--

1			
2			
3			
4			
5	Harms	22	Plans for collecting, assessing, reporting, and managing solicited and spontaneously reported adverse events and other unintended effects of trial interventions or trial conduct
6	Auditing	23	Frequency and procedures for auditing trial conduct, if any, and whether the process will be independent from investigators and the sponsor
7	<hr/>		
8	Ethics and dissemination		
9	Research ethics approval	24	Plans for seeking research ethics committee/institutional review board (REC/IRB) approval
10	Protocol amendments	25	Plans for communicating important protocol modifications (e.g., changes to eligibility criteria, outcomes, analyses) to relevant parties (e.g., investigators, REC/IRBs, trial participants, trial registries, journals, regulators)
11	Consent or assent	26a	Who will obtain informed consent or assent from potential trial participants or authorised surrogates, and how (see Item 32)
12		26b	Additional consent provisions for collection and use of participant data and biological specimens in ancillary studies, if applicable
13	Confidentiality	27	How personal information about potential and enrolled participants will be collected, shared, and maintained in order to protect confidentiality before, during, and after the trial
14	Declaration of interests	28	Financial and other competing interests for principal investigators for the overall trial and each study site
15	Access to data	29	Statement of who will have access to the final trial dataset, and disclosure of contractual agreements that limit such access for investigators
16	Ancillary and post-trial care	30	Provisions, if any, for ancillary and post-trial care, and for compensation to those who suffer harm from trial participation
17	Dissemination policy	31a	Plans for investigators and sponsor to communicate trial results to participants, healthcare professionals, the public, and other relevant groups (e.g., via publication, reporting in results databases, or other data sharing arrangements), including any publication restrictions
18		31b	Authorship eligibility guidelines and any intended use of professional writers
19		31c	Plans, if any, for granting public access to the full protocol, participant-level dataset, and statistical code
20	<hr/>		
21	Appendices		
22	Informed consent materials	32	Model consent form and other related documentation given to participants and authorised surrogates
23	Biological specimens	33	Plans for collection, laboratory evaluation, and storage of biological specimens for genetic or molecular analysis in the current trial and for future use in ancillary studies, if applicable

Supplementary Table S1. Donor Questionnaire

Inclusion criteria		Response
1.	Aged 18 to 50	
2.	Gender	
3.	Height	
4.	Weight	
5.	Body Mass Index (< 30)	

Exclusion criteria		Response
Gastrointestinal		
7.	Have you or a direct relative (parents, siblings or children) suffered from colon cancer or polyposis?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
8.	Have you or a direct relative (parents, siblings or children) suffered from intestinal inflammatory disease (Crohn disease or ulcerative colitis)?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
9.	Do you regularly have a fever or intestinal disorders, such as diarrhoea, abdominal pain or blood in the stools?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
10.	Do you suffer from celiac disease or other chronic digestive disorders?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
11.	Are you diabetic?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
Neurologic		
12.	Have you taken medications in the last 12 months, or have you been in treatment or in consultation for attention deficit or hyperactivity?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
13.	Have you taken medication in the last 12 months, or have you been in treatment or in consultation for depression?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
14.	In the last 12 months, have you regularly experienced symptoms of depression?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
15.	Have you taken medications in the last 12 months, or have you been in treatment or in consultation for anxiety?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
16.	In the last 12 months, have you regularly experienced symptoms of anxiety?	<input type="checkbox"/> YES <input type="checkbox"/> NOT

Bmjopen-2021-058124_Supplemental Material

17.	Do you have any seasonal, food, animal, medication, latex, dust or other allergies?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
18.	Have you had symptoms of eczema or psoriasis in the last eight weeks?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
19.	Have you taken antibiotics, antifungals, antivirals, or any other drug that can alter the microbiota in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
20.	Have you taken medications related to gastric reflux?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
21.	Have you had an asthma attack in the last 12 months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
22.	Have you had unprotected sex with a new partner in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
23.	Have you had a fever, frequent cough, or felt short of breath in the last two weeks?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
24.	Have you gotten a new tattoo in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
25.	Have you had a piercing in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
26.	Have you been vaccinated with live attenuated virus vaccines in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
27.	Have you received an injection or vaccine in the last 8 weeks?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
28.	Does your work or activity as a volunteer involve any contact with any animal or plant tissue, chronic patients, nursing homes or hospital?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
29.	Do you have or have you ever had any type of cancer?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
30.	If you are a woman, is there a chance you are pregnant?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
31.	If you are a woman, Have you had a delivery or a termination of pregnancy in the last 6 months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
32.	What countries have you visited in the last 12 months?:	
33.	What is your highest degree of education?	
34.	Are you interested in receiving additional information?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
35.	Reason for donating: to fight <i>C. difficile</i> , earn money, supporting research, helping patients, other.	

* Patients with affirmative responses to questions number 6, 19, 20, 23, 24, 25, 26, 27, 30, 31 and 32 (depending on the country) are classified as temporarily unrecruitable.

* Patients with affirmative responses to questions number 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 21, 22, 28 y 29 are classified as definitively unrecruitable.

Supplementary Table S2. Interview with the donor

GENERAL CRITERIA	Response
1. Do you suffer, or have you ever suffered from any major illness (including in childhood)?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
2. Are you being studied for any health problems?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
3. Have you ever been admitted to a hospital?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
4. Have you ever had surgery?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
5. Did you receive breastfeeding in childhood?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
6. Have you received the vaccines correctly according to the vaccination schedule?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
7. Do you take any treatment regularly? If yes, please specify:	<input type="checkbox"/> YES <input type="checkbox"/> NOT
8. Are you allergic to any medication or food?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
9. Do you drink alcohol regularly?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
10. Do you smoke? How many cigarettes a day?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
11. Have you had surgery in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
12. Have you had a gastroscopy or colonoscopy in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
13. Have you had a tattoo or piercing in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
14. Have you been treated with acupuncture or suffered an accidental needle stick in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
15. In the last 12 months, have you had contact with another person's blood?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
16. Have you changed your sexual partner in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
17. Have you had more than one sexual partner in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
18. Have you had any sexually transmitted infections in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
19. Have you used any illicit drug intravenously, inhaled, snorted or by another route in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
20. If you are a woman, is there any chance you are pregnant?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
21. If you are a woman, have you had a delivery or a termination of pregnancy in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
Digestive criteria	Response

Bmjopen-2021-058124_Supplemental Material

22.	What is the frequency of your bowel movements?	
23.	What is the usual time you pass stools?	
24.	What is the usual consistency of your stools?	
25.	Do you suffer from any digestive disease?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
26.	Are you diabetic?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
27.	Do you suffer from irritable bowel syndrome, chronic functional constipation or chronic functional diarrhoea?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
28.	Do you have celiac disease or any other chronic digestive disorders?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
29.	Have you recently had diarrhoea, bloody stools, abdominal pain, or any other significant digestive symptoms in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
30.	Do you have a history or high risk of gastrointestinal cancer or polyposis?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
31.	Has anyone in your family had colon cancer? (parents, siblings or children)	<input type="checkbox"/> YES <input type="checkbox"/> NOT
32.	Is there anyone diagnosed with Chron's disease or ulcerative colitis in your family? (parents, siblings or children)	<input type="checkbox"/> YES <input type="checkbox"/> NOT
33.	Have you undergone major surgery on the digestive system? (excluding appendectomy) (parents, siblings or children)	<input type="checkbox"/> YES <input type="checkbox"/> NOT
Infectious Diseases Criteria		Response
34.	Have you or someone close to you suffered from a COVID-19 infection?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
35.	Have you suffered from malaria, Chagas disease or babesiosis?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
36.	Have you ever had a positive test for HIV?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
37.	Have you ever had HTLV (human T-cell lymphotropic virus type 1 and 2) or tuberculosis?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
38.	Have you had risky sexual relations (i.e. sexual contact with strangers, prostitutes, drug addicts, patients with HIV, patients with viral hepatitis, syphilis or have you worked as a prostitute?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
39.	In the last 12 months, have you had sexual contact with someone who used needles for drugs, steroids or anything else that a doctor did not prescribe?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
40.	In the last 12 months, have you had or been treated for any sexually transmitted disease? (syphilis, gonorrhoea)	<input type="checkbox"/> YES <input type="checkbox"/> NOT
41.	Have you had sexual contact with someone with HIV, hepatitis B or hepatitis C?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
42.	Have you been in contact with another person's blood or been pricked with any Sharp material that could be contaminated with another person's blood or fluids in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT

43.	In the last 12 months, have you had sexual contact with someone suffering from haemophilia or receiving clotting factor concentrates?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
44.	If you are a female donor, in the last 12 months, have you had sexual contact with a man who has ever had sexual contact with another man?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
45.	If you are a male donor, have you ever had sexual contact with another man?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
46.	Have you had any recent infections by gastrointestinal microorganisms?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
47.	Have you been outside of Spain in the last three years? Discuss your trips and activities with your doctor.	<input type="checkbox"/> YES <input type="checkbox"/> NOT
48.	Have you ever spent more than a month in any country in Latin America, Asia or Africa?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
49.	Have you travelled in the last six months to tropical countries with endemic diarrheal diseases or those with a risk of traveller's diarrhoea?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
50.	Between 1980 and 1996, were you in the UK for more than three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
51.	From 1980 to the present, have you received a blood transfusion in the UK or France?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
53.	Have you had contact with someone vaccinated for smallpox in the last eight weeks?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
54.	Have you been vaccinated with live attenuated virus vaccines in the last six months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
55.	Have you had an injection or vaccine in the last eight weeks?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
Others		Response
56.	Do you have cancer, or have you had it in the last ten years?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
57.	Do you suffer from any blood disease or any tendency to bleed?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
58.	Have you received any transfusion of blood or derived products in the last 12 months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
59.	Have you received a tissue (bone or skin), organ, or bone marrow graft in the last 12 months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
60.	Have you ever had a dura mater graft or brain sheath graft?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
61.	In the last 16 weeks, have you donated red blood cells through an apheresis machine?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
62.	Do any of your relatives have Creutzfeld-Jakob disease?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
63.	In the last 12 months, have you been in a correctional or correctional facility or arrested for more than 72 hours?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
64.	Are you a health worker or a worker in a hospital or health institution?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
65.	Do you work with animals?	<input type="checkbox"/> YES <input type="checkbox"/> NOT

Bmjopen-2021-058124_Supplemental Material

66. Do you have the legal capacity to sign informed consent?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
67. Have you ever had any heart or liver problems?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
68. Do you have chronic hepatitis?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
69. Do you suffer from chronic renal insufficiency?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
70. Do you suffer from autoimmune diseases affecting the digestive tube?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
71. Do you suffer from metabolic syndrome?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
72. Do you suffer from any neurological, neurodegenerative or psychiatric disease?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
73. Do you suffer from vascular disease?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
Drugs	Response
74. Have you taken antibiotics, antifungals, antivirals, or any other drug that alters the microbiota in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
75. Have you taken proton pump inhibitors in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
76. Have you received immunosuppressive medication or chemotherapy in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT
77. Have you received systemic antineoplastic agents in the last three months?	<input type="checkbox"/> YES <input type="checkbox"/> NOT

Supplementary Table S3. Microbiological screening for donors

1. DONOR BLOOD SCREENING			
1.1. GENERAL LABORATORY			
1.1.1.	Hemogram <input type="checkbox"/>		
1.1.2.	Biochemistry: <table border="0" style="width: 100%;"> <tr> <td style="width: 50%; vertical-align: top;"> <input type="checkbox"/> Creatinine <input type="checkbox"/> Urea <input type="checkbox"/> Glucose <input type="checkbox"/> Sodium <input type="checkbox"/> Potassium <input type="checkbox"/> Chloride <input type="checkbox"/> Calcium <input type="checkbox"/> Magnesium </td> <td style="width: 50%; vertical-align: top;"> <input type="checkbox"/> Phosphorus <input type="checkbox"/> Uric acid <input type="checkbox"/> Alanine aminotransferase <input type="checkbox"/> Aspartate aminotransferase <input type="checkbox"/> Alkaline phosphatase <input type="checkbox"/> Total bilirubin <input type="checkbox"/> Albumin <input type="checkbox"/> C-reactive protein </td> </tr> </table>	<input type="checkbox"/> Creatinine <input type="checkbox"/> Urea <input type="checkbox"/> Glucose <input type="checkbox"/> Sodium <input type="checkbox"/> Potassium <input type="checkbox"/> Chloride <input type="checkbox"/> Calcium <input type="checkbox"/> Magnesium	<input type="checkbox"/> Phosphorus <input type="checkbox"/> Uric acid <input type="checkbox"/> Alanine aminotransferase <input type="checkbox"/> Aspartate aminotransferase <input type="checkbox"/> Alkaline phosphatase <input type="checkbox"/> Total bilirubin <input type="checkbox"/> Albumin <input type="checkbox"/> C-reactive protein
<input type="checkbox"/> Creatinine <input type="checkbox"/> Urea <input type="checkbox"/> Glucose <input type="checkbox"/> Sodium <input type="checkbox"/> Potassium <input type="checkbox"/> Chloride <input type="checkbox"/> Calcium <input type="checkbox"/> Magnesium	<input type="checkbox"/> Phosphorus <input type="checkbox"/> Uric acid <input type="checkbox"/> Alanine aminotransferase <input type="checkbox"/> Aspartate aminotransferase <input type="checkbox"/> Alkaline phosphatase <input type="checkbox"/> Total bilirubin <input type="checkbox"/> Albumin <input type="checkbox"/> C-reactive protein		
1.1.1.	Lipids: <ul style="list-style-type: none"> <input type="checkbox"/> Triglycerides <input type="checkbox"/> Total cholesterol <input type="checkbox"/> High-density lipoprotein <input type="checkbox"/> Low-density lipoprotein 		
1.2. MICROBIOLOGICAL STUDIES			
Hepatitis A virus: <input type="checkbox"/> Immunoglobulin M (IgM) <input type="checkbox"/> Immunoglobulin G (IgG)			
Hepatitis B virus: <input type="checkbox"/> Serum hepatitis B surface antigen <input type="checkbox"/> Antibodies to hepatitis B core antigen (IgG) <input type="checkbox"/> Antibodies to hepatitis B core antigen (IgM) <input type="checkbox"/> Hepatitis B surface antibody			
Hepatitis C virus: <input type="checkbox"/> Hepatitis C immunoglobulin			
Hepatitis E virus: <input type="checkbox"/> Ig M			

Bmjopen-2021-058124_Supplemental Material

<input type="checkbox"/> Ig G
Human immunodeficiency virus: <input type="checkbox"/> HIV-1/HIV-2 antibodies/p24 test
SARS-COV-2: <input type="checkbox"/> Ig M
<input type="checkbox"/> Ig G
Syphilis: <input type="checkbox"/> Rapid plasma reagin (If reactive, a FTA-ABS test will be performed)
Cytomegalovirus: <input type="checkbox"/> IgM
<input type="checkbox"/> IgG
Epstein-Barr virus: <input type="checkbox"/> IgM
<input type="checkbox"/> IgG
2. SCREENING OF DONOR FECES
<input type="checkbox"/> <i>Clostridioides difficile</i> : Glutamate dehydrogenase (GDH9 testing assay and/or toxin A and B. (if GDH is positive, a test for toxins A and B or culture will be performed)
<input type="checkbox"/> <i>Giardia Lamblia</i> antigen test
<input type="checkbox"/> Helicobacter Pylori antigen test
<input type="checkbox"/> Strongyloides
<input type="checkbox"/> <i>Giardia lamblia</i>
<input type="checkbox"/> <i>Salmonella</i> spp.
<input type="checkbox"/> <i>Shigella</i> spp.
<input type="checkbox"/> <i>Campylobacter</i> spp.
<input type="checkbox"/> Enteropathogenic <i>Escherichia coli</i>
<input type="checkbox"/> <i>Yersinia</i> spp.
<input type="checkbox"/> <i>Vibrio cholerae</i>
<input type="checkbox"/> <i>Listeria monocytogenes</i>
<input type="checkbox"/> Blastocystis
<input type="checkbox"/> <i>Entamoeba histolytica</i>
