This supplemental material has been provided by the authors to give readers additional information about their work.

A. Identify hospitals providing cancer surgeries in 2013

eTable 1. Selection of cancer surgery episodes in 2013 in Maryland and control states

	Maryland		Control	states
	N,	%, prior	N,	%, prior
	patients	step	patients	step
Select Medicare beneficiaries residing in Maryland and	3,893		6,359	
control states [#] , who had cancer-related surgery [†] in a				
short term hospital within the same state as their				
residence.				
For Maryland, exclude those whose surgery performed	3,525	90.5%	6,359	100.0%
in the 10 hospitals in the TPR program [‡] .				
Select those who were 66 or older at the surgery.	3,026	85.8%	5,262	82.7%
Select those who had continuous parts A&B without	2,634	87.0%	4,735	90.0%
managed care enrollment in the 12 months before				
surgery admission and 30 days after discharge or till				
death if they died within 30 days of discharge.				
Exclude surgery claims not reimbursed by Medicare	2,619	99.4%	4,710	99.5%

^{*}Including Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Hawaii, Illinois, Iowa, Kentucky, Massachusetts, Minnesota, Nevada, New Jersey, New Mexico, New York, North Dakota, Ohio, Oregon, Rhode Island, Vermont, Washington, and West Virginia. For Maryland, West Virginia, Delaware, and DC, 100% Medicare data were available; for other states, 5% data were available.

At the end of the selection, there were 35 hospitals from Maryland and 805 hospitals from control states. We used the greedy nearest neighbor matching technique to match these two groups of hospitals by the propensity of being a Maryland hospital, estimated by a logistic regression model which included the hospital characteristics in 2013: total beds, resident to bed ratio, disproportionate share hospital patient percent, percent capacity (average daily census divided by total beds), transfer-adjusted case mix, total inpatient surgical operations, total outpatient surgical operations, nurse staffing ratio (ref 3), and medical school affiliation.

[†]Identified from inpatient and outpatient claims using surgery codes in Oncology Care Model (ref 1) and additional codes from literature (ref 2). Codes for reconstruction or repair procedures were not used. All surgery claims need to be accompanied with a cancer diagnosis code (ref 1) as the primary diagnosis. The complete list of surgery codes is at the end of the supplement (eTable 4). Emergent surgeries were not included.

[‡]TPR=Total Patient Revenue.

B. Study cohort selection

We followed the same selection process in eTable 1 to identify patients with cancer surgery at the 136 matched hospitals (35 in Maryland and 101 in control states) between January 2011 and November 2018. At the end of the selection, for each Maryland hospital, we made sure its matched controls had data from the same data years and vice versa. For example, if a Maryland hospital has data between 2011 and 2016 while its matched control hospitals have data between 2012 and 2018, the data between 2012 and 2016 for this matched set of hospitals would be included in the analysis. With this restriction, all matched sets still had data from both pre- and post-GBR periods.

eTable 2 shows the number of patients receiving a cancer surgery in Maryland and matched control hospitals by year as well as their characteristics. eTable 3 shows the characteristics of patients receiving an inpatient major cancer surgery (ref 2, eTable 4).

eTable 2. Patient characteristics in the main cohort (all inpatient and outpatient cancer surgical episodes from Maryland and matched control hospitals)

Abs. std. diff. = Absolute standardized difference.

C. Model specification for estimating difference-in-differences

For each outcome measure, we used a linear regression model to estimate the difference-in-differences (D-i-D). (ref 4) For binary outcome measures, this is also known as the linear probability model. The estimating equation has the form:

$$E(y_{iht}) = \beta_0 + \beta_1 Hospital_h + \beta_2 Year_t + \beta_3 Patient_f actors_{iht} + \delta_0 \mathbf{1}[h \in MD, t = 2014] + \delta_{post} \mathbf{1}[h \in MD, t > 2014] + \varepsilon_{iht}$$

where y_{iht} is the outcome measure for patient i in hospital h and year t, $Hospital_h$ is a vector of hospital fixed effects, $Hospital_h$ is a vector of year fixed effects, $Hospital_h$ is a vector of patient characteristics that were unbalanced between Maryland and the control group, $Hospital_h$ is a dummy variable that is equal to 1 if the hospital is in Maryland and the year is 2014. This term is to remove the year of 2014 from the D-i-D estimation. $Hospital_h$ is a dummy variable that is equal to 1 if the hospital is in Maryland and the year is after 2014. The parameter $Hospital_h$ estimates the D-i-D in the outcome measure for Maryland hospitals from the pre-GBR period to the post period.

D. Counterfactual assumption

Before estimating the difference-in-difference (D-i-D) in the outcome measure, we used the following equation to examine if Maryland hospitals and their matched control hospitals had similar trends before 2014. The δ_k parameters estimate the difference between Maryland and control hospitals in the whole study period. Parameters δ_{-3} , δ_{-2} , and δ_{-1} are for the pre-GBR period and δ_1 - δ_4 are for the post-period. If the parameter estimates for the preperiod are close to zero, it means these two groups of hospitals have similar trends before 2014.

$$E(y_{iht}) = \beta_0 + \beta_1 Hospital_h + \beta_2 Year_t + \beta_3 Patient_factors_{iht} + \sum_{k=-3}^{4} \delta_k \mathbf{1}[h \in MD, t = 2014 + k] + \varepsilon_{iht}$$

For each cohort and outcome, these δ_k estimates were plotted by year (eFigures 1 and 2).

Part I. Main cohort (all inpatient and outpatient cancer surgical episodes from Maryland and matched control hospitals)

a. Total Medicare payment during episode

Likelihood ratio test for th pre-trend, p=0.60

b. Any ED visit in 30 days

Likelihood ratio test for th pre-trend, p=0.16

c. Any readmission in 30 days

Likelihood ratio test for th pre-trend, p=0.15

d. Mortality in 30 days

Likelihood ratio test for th pre-trend, p=0.57

eFigure 1. Annual D-i-D estimates. The coefficient estimates in the figures measure how much the trend for Maryland hospitals depart from the trend for control hospitals before and after GBR implementation. If the estimates before 2014 are not significantly different from zero, it means Maryland hospitals and control hospitals share similar trends before GBR. The year of 2013 is the reference of comparison. The null hypothesis of the likelihood ratio test was that coefficients in the pre-period were all equal to zero.

Conclusion:

None of the estimates in the pre-period were significantly different from zero. That is, no significant violation of the counterfactual assumption was observed.

Part II. Inpatient major cancer surgery sub-cohort

a. Total Medicare payment during episode

Likelihood ratio test for th pre-trend, p=0.70

c. Any readmission in 30 days

Likelihood ratio test for th pre-trend, p=0.36

e. Discharged to SNF/IRF

Likelihood ratio test for th pre-trend, p=0.17

b. Any ED visit in 30 days

Likelihood ratio test for th pre-trend, p=0.69

d. Mortality in 30 days

Likelihood ratio test for th pre-trend, p=0.59

eFigure 2. Annual D-i-D estimates. The coefficient estimates in the figures measure how much the trend for Maryland hospitals depart from the trend for control hospitals before and after GBR implementation. If the estimates before 2014 are not significantly different from zero, it means Maryland hospitals and control hospitals share similar trends before GBR. The year of 2013 is the reference of comparison. The null hypothesis of the likelihood ratio test was that coefficients in the pre-period were all equal to zero.

Conclusion:

None of the estimates in the pre-period were significantly different from zero. That is, no significant violation of the counterfactual assumption was observed.
