**eFigure 1. Univariable cardiovascular survival by SV<sub>ICMR</sub>**

Kaplan-Meier Plots demonstrating differences in cardiovascular mortality when the cohort is divided by different SV<sub>ICMR</sub> thresholds. A, SV<sub>ICMR</sub> threshold of 35ml/m<sup>2</sup>; B, SV<sub>ICMR</sub> threshold of 45ml/m<sup>2</sup>; C, SV<sub>ICMR</sub> threshold of 55ml/m<sup>2</sup>; D, SV<sub>ICMR</sub> threshold of 65 ml/m<sup>2</sup>.

**eFigure 2.** Partial association plots of hazard ratio of all-cause death

Plots demonstrating the association between individual variables and cardiovascular mortality. The shaded area represents the 95% confidence interval. A, Indexed stroke volume; B Left ventricular ejection fraction; C, Right ventricular ejection fraction; D STS score; E Age.
