Vietnam	DHS 2002, MICS 2000, 2006, 2011, 2014
Zambia	DHS 2002, 2007, 2014, 2018
Zimbabwe	DHS 2006, 2011, 2015; MICS 2009, 2014, 2019

DHS, Demographic and Health Survey; MICS, Multiple Indicator and Cluster Survey

## **Appendix e-method 1: sensitivity analysis**

Both covariates and the model's hierarchical structure influence how data from other countries influence predictions for a given country.<sup>1</sup> We examined the sensitivity of our results by two approaches: (1) the exclusion of country-level covariates (SDI and HRH), and (2) altering priors for the hyperparameters.

### *Sensitivity analysis: assessing the role of country-level covariates:*

Excluding country level predictors, the median absolute differences between the two sets of results and DIC values were compared.

### *Altering priors for the hyperparameters:*

Previous studies reported that to borrow strength and facilitate parameters smoothening from each group, the hyperparameters were shared by all intercept coefficients.<sup>2,3</sup> The key benefit of assigning the hyperparameter is the fact that the resulting model gains the advantages of a complete-pooled model and a no-pooled model. The half-Cauchy is quite heavy tailed and considered as fairly weakly informative. Gelman (2006) advocates for half-t priors (including the half-Cauchy) over the inverse gamma. The hyperparameter priors (hyper-priors) were assigned flat non-informative prior distributions for main analysis and weekly informative hyper-priors for sensitivity analysis. In our proposed model,  $\beta_{ij}$  are conditionally normally distributed on  $\beta_k, \sigma_k^2$  while  $\beta_k$  is conditionally normally distributed on  $\beta$  and  $\sigma^2$ . In the main analysis,  $\beta = [\beta_0, \beta_1, \beta_2]$  is the normal distribution was specified in terms of mean zero and the standard deviation of 100,  $[\beta_0, \beta_1, \beta_2] \sim N(0, 0.0001)$ . Since the hyperparameter have some influences on all intercept coefficients, the half-Cauchy distribution (weekly informative prior) applied to perform sensitivity analysis instead of gamma distribution, hyperparameters ( $\tau, \sigma_k$ , and  $\sigma$ )~ half-Cauchy (0,25). After altering prior distribution, the median absolute differences between the two sets of results and DIC values were also compared.

Table S2: Coverage of at least single antenatal visits by age group in 54 LMICs, 2000-2030

Country	Predicted coverage, proportion (95% CrI)					
	Aged 20-35 years			Aged 36-49 years
