

Supplementary Figure S1

Figure S1. Phylogenetic tree of 1,663 genomes from the *Mycobacterium abscessus* complex (MABC), based on core genome MLST. The three clusters representing the subspecies *M. abscessus* subsp. *abscessus* (orange, abscessus), *M. abscessus* subsp. *bolletii* (red, bolletii) and *M. abscessus* subsp. *massiliense* (blue, massiliense) are indicated in the first bar. The other bars show the *in silico* PCR predictions with the MABC subspecies-specific PCRs (Tables 1 & 2). Orange, red and blue lines represent a match of the PCR with the relevant MABC subspecies, a black line represent a predicted PCR-positivity outside the associated MABC subspecies.

Supplementary Figure S2

Figure S2. Tanglegram comparing phylogenetic trees derived from 318 genomes of the *Mycobacterium abscessus* complex (MABC), showing that clustering to identify the MABC subspecies is comparable between the two methods, but that within the MABC subspecies there are differences in clustering. The tree on the left is based on core genome single nucleotide polymorphisms, the tree on the right is based on core genome MLST. The three clusters representing the subspecies *M. abscessus* subsp. *abscessus* (orange), *M. abscessus* subsp. *bolletii* (red) and *M. abscessus* subsp. *massiliense* (blue) are indicated in the colour bars.

Table S1. Information of *Mycobacterium abscessus* Complex genomes used in this study, including their in silico PCR outcome with the 6 sets of PCR primers.

1. SNP: Order in the core genome SNP tree shown in Figure 2, from top to bottom. cgMLST: Order in the cgMLST tree shown in Figure S2, from top to bottom.
2. Assignment to MABC subspecies. Mbaa = *M. abscessus* subspecies *abscessus*, Mbab = *M. abscessus* subspecies *bolletii* and Mbam = *M. abscessus* subspecies *massiliense*.
3. Genus/species/subspecies description as used in the NCBI Genomes database.
4. Accession number to the genome assembly used in the analysis.
